

METHOD OF ACUPUNCTURE WITH PROLONGED ACTION

ABSTRACT

An invention relates to the field of medicine, and particularly to reflexotherapy and can be used for a prolonged acupunctural action upon an organism of a patient.

In the method of acupuncture with prolonged action in which acupuncture points are selected, selected is a point of needle entry and needle exit, passing the needle through the selected entry and exit points leaving both ends outside a patient's skin, fixing the needle in this position by locking members, installed at the end of the needle, and after the end of acupuncture session leaving the needle in the patient's body for an assigned period of time, the new is that by means of introducing the needle acusal tracts are formed in different histological layers of the patient's tissues, and as entry and/or exit points of each needle selected are the points located in the acupuncture point region, and/or reflexogenic zone, and/or indifferent zone.

The application of the proposed method of acupuncture with a prolonged action permits to provide an effective treatment by non-medicamental method of a wide range of diseases, as well as raise the efficiency of acupuncture with a prolonged action. In implementation of the method a relatively simple and inexpensive equipment can be used, providing the efficiency of treatment with practically an absence of side affects permit, which permits to provide for a wide application of the proposed method in medical practice.
