

ABSTRACT
CONTENT INPUT METHOD AND APPARATUS

5 A content input method and apparatus. The method comprises: when a display event appears in an input box, responding to the display event and displaying the input box and a voice input control corresponding to the input box, to allow a user to directly carry out a voice input operation on a first voice input control; and then responding to the voice input operation, receiving voice data inputted by the user, converting the voice data inputted by the user into a display content that can be presented in a first input box, and displaying the content in the first
10 input box. Hence, a user can directly carry out a voice input operation on a displayed voice input control, thereby reducing operation steps required to be executed before the user carries out the voice input operation, improving the input efficiency of the user, and avoiding the problem that a user is unable to implement voice input because there is no voice input control on the keyboard of an input method.
