(54) Title: EXPRESS PACKAGE DELIVERY THROUGH RECIPIENT LOCATION DETECTION

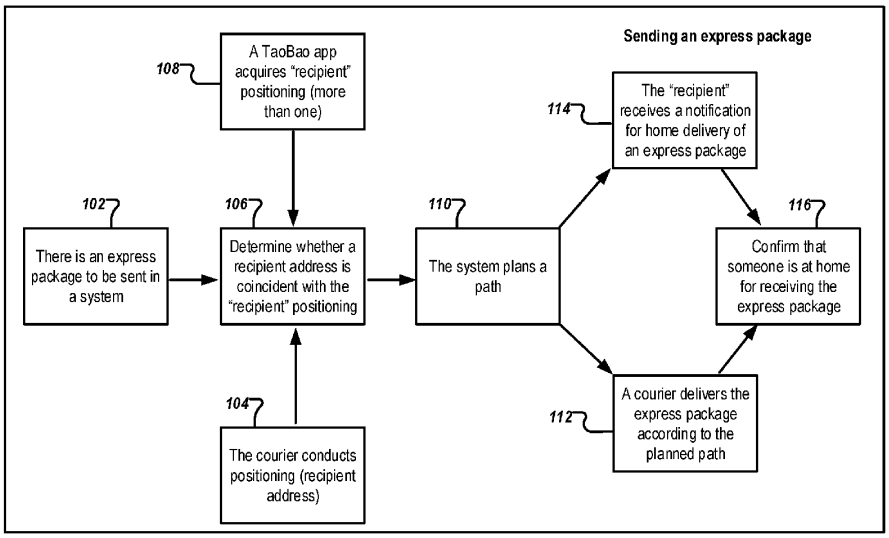

FIG. 1

(57) Abstract: An express package delivery request is received from a courier terminal that indicates identifier information of a courier and first positioning information corresponding to a location of the courier. The express package delivery content information corresponding to a recipient address is retrieved from a database. The identifier information of the courier and the first positioning information corresponding to the location of the courier is determined to be within proximity to the retrieved recipient address. The second positioning information of a recipient that can receive an express package is determined corresponding to an account in the retrieved express package delivery content information. A notification is provided to the courier terminal to deliver the express package identified in the express package delivery request if the determined second positioning information of the recipient coincides with the retrieved recipient address.
