ABSTRACT

The disclosure provides a stool collection system that can automatically collect and prepare the entirety of stool from a test subject on an ongoing basis. The stool collection system according to the disclosure is characterized by comprising: a preparation chamber that is communicated with a toilet seat; a conveyance mechanism that disposes a container for collecting the stool at a prescribed position with respect to the toilet seat, and that recovers, into the interior of the preparation chamber, the container in which the stool was loaded; a drier for drying the recovered stool; a crusher that crushes the dried stool; and a packaging machine for packaging the crushed stool.
