

ABSTRACT

The present invention relates to the field of communications, and provides a cell reselection method and device and a storage medium. The cell reselection method is executed by a terminal, and comprises: determining that a target cell does not support one or more network slices of the
5 terminal; and determining whether to reselect the target cell and/or a same-frequency cell of the target cell. By means of the present invention, a slice-based cell reselection solution in the scenario of being unable to access due to the target cell does not support terminal slices is implemented.
