ABSTRACT

In an ion air blower 1 of the present invention, an opening/closing door 13 opens downward substantially by 90 degrees, so that discharge needles 16 are directed upward. In this case, since the direction of the discharge needles 16 do not intersect a blower body 10, at the time of maintenance, when the discharge needle 16 is pulled out, fingers and the hand move upward, and do not collide against the blower body 10 and the opening/closing door 13.
