

A METHOD AND APPARATUS FOR PROVIDING INFORMATION FOR DISPLAY

Abstract of the Invention

5

A first data (4) is stored in storage location (14) in the display memory (13) having an address P1, and a second data (6) is stored in storage location (15) having an address P2. The first data (4) is displayed in first window (35) on the display (30) having location coordinates X1,Y1
10 while the second data (6) is displayed in second window (36) having location coordinates X2,Y2. When the first window (35) is moved to a new location, the coordinates X1, Y1 are updated with the coordinates of the new location, and the new coordinates are provided to the controller (20). The controller (20) provides the memory address P1 to the memory
15 (13), and the first data (4) is provided to the display (30) via the controller (20) and displayed at the new location on the display (30).
