(54) Title: OPTHALMIC LENS FOR MYOPIA CONTROL

FIG. 10

(57) Abstract: An ophthalmic lens for slowing or preventing the progression of myopia having a lens center, a shape defined by a lens outer peripheral edge, and an optic zone surrounding lens center and having an outer periphery. The optic zone has a central optic zone surrounding the lens center and defined by a central optic zone radius, and a peripheral optic zone surrounding the central optic zone and extending to the optic zone outer periphery. The lens includes a plurality of myopic defocus zones each positioned at a predetermined radial distance from the lens center, and each introducing a predetermined ADD power that increases with increased radial distance from lens center up to a radius of at least 4mm. At least a first myopic defocus zone is positioned within the central optic zone, and at least first and second myopic defocus zones are positioned in the peripheral optic zone.
