

ABSTRACT

A decoding method and device, and a computer readable storage medium, relating to the field of computer technology. Said method comprises: buffering one or more stream segments of a received data stream (S102), the data stream comprising an audio stream; parsing the buffered stream segments until header information is parsed and obtained (S104); saving the header information (S106); and decoding the stream segments of the audio stream in each received stream segment according to the header information until decoding of the audio stream is completed (S108).
