

ABSTRACT

(Problems to be solved)

5 The present invention provides a fullerene suspension and a
method for producing a fullerene suspension having high dispersion
stability without any chemical compound. Also, the fullerene
suspension and its producing method makes it possible to be applied
in various fields including the field of medical and pharmaceutical
10 science and the field of foods and environment, in which the fullerene
suspension obtained by the prior methods had not been applied.

(Means for solving the problems)

15 The fullerene is ground to form nanoparticles by irradiating
a fullerene in a poor solvent with a laser. The pulse laser having
a width of several-ten femtoseconds to several-hundred nanoseconds
is appropriately applied.
