

Abstract**Shower Apparatus**

5 The shower apparatus comprising a first compartment tank having an inlet opening and an outlet opening, whereby the tank is formed hollow for accommodating a first filter element in rolled form to filter the water supplied to the first compartment tank via the inlet opening; and a second compartment tank having an inlet opening and an outlet opening, whereby the tank is formed hollow for accommodating a second filter element having a plurality of filter
10 segments containing filtering media which are vertically mounted together to filter the filtered water from the first compartment tank. The filtered water passes through the outlet opening of the first compartment tank into the inlet opening of the second compartment tank by means of a conduit and the filtered water from the second compartment tank is discharged from the outlet opening of the second compartment tank. The water can be
15 discharged via a shower head.
