

LIQUID-SPRAYING DEVICE

ABSTRACT

Provided is a liquid spray device highly effectively preventing a poisonous gas and an odor contained in a liquid to be sprayed from diffusing in the environment.

A base (26) includes an ejection orifice (30) for ejecting acidic water. The base (26) includes a first feed path (28) communicating with the ejection orifice (30) so as to feed acidic water and a second feed path (29) communicating with a plurality of spray orifices (34) so as to feed alkaline water. The second feed path (29) is open so that its front end continuously makes a circuit on the side surface of the base (26). A rotary part (27) is disposed so as to rotate along the side surface of the base (26). The rotary part (27) includes the plurality of spray orifices (34) disposed so as to surround the periphery of the ejection orifice (30). The rotary part (27) includes a plurality of communication paths (33) communicating with the respective spray orifices (34) and the second feed path (29). The respective spray orifices (34) spray alkaline water while rotating around the periphery of the ejection orifice (30) as the center so as to surround the periphery of acidic water ejected from the ejection orifice (30) with the alkaline water in a curtain-like manner.
