

[ABSTRACT]

The diaphragm valve comprises a body with a flow path, a stem, a diaphragm, a diaphragm depressor attached to the lower end of the stem, and a connecting member which connects the diaphragm and the diaphragm depressor. Further, the connecting member has a rod-shaped part to be connected to the diaphragm depressor and a flange part which is radially protruding in a circular shape at the lower end of the connecting member and having at least one notch on the outer peripheral edge. Furthermore, the rod-shaped part has a radially concaved constriction part above the flange part, and the flange part and the constriction part are embedded in the central part of the diaphragm.
