

ABSTRACT

Embodiments of the specification provide a data processing method and apparatus, where the data processing method includes: receiving a tag operation instruction for a data file, and storing tag operation information associated with the tag operation instruction in an operation log; updating a data operation table associated with the data file according to the tag operation information recorded in the operation log in a case where the operation log meets a log information processing condition; and generating a data operation request corresponding to a target data node based on an updated data operation table, and sending the data operation request to the target data node. The data operation table is updated according to the operation log, thereby determining the target data node according to the data operation table, and executing a tag operation at the target data node, which achieves collaborative processing of the data file based on the tag operation instruction.
