PROCESS FOR PREPARING JAK INHIBITORS AND INTERMEDIATES THEREOF

10

BACKGROUND OF THE INVENTION

15

Field of the Invention

The invention is directed to a process for preparing compounds which are useful as an intermediates for the preparation of medicinal agents. In particular, the invention is directed to the preparation of intermediates to JAK inhibitors.

20

State of the Art

The JAK family comprises four members, JAK1, JAK2, JAK3, and tyrosine kinase 2 (TYK2). Binding of cytokine to a JAK-dependent cytokine receptor induces receptor dimerization which results in phosphorylation of tyrosine residues on the JAK kinase, effecting JAK activation. Phosphorylated JAKs, in turn, bind and phosphorylate various STAT proteins which dimerize, internalize in the cell nucleus and directly modulate gene transcription, leading, among other effects, to the downstream effects associated with inflammatory disease. The JAKs usually associate with cytokine receptors in pairs as homodimers or heterodimers. Each of the four members of the JAK family is implicated in the signaling of at least one of the cytokines associated with inflammation. Consequently, a chemical inhibitor with pan-activity against all members of the JAK family could modulate a broad range of pro-inflammatory pathways that contribute to lung inflammatory diseases such as severe asthma, COPD, and Chronic Lung Allograft Dysfunction (CLAD). It would therefore be desirable to have an efficient process for preparing specific JAK inhibitors.

- 20 Bis(pinacolato)diboron (250 g, 984 mmol) was charged to a 5 L 3-neck single walled flask previously etched using fluoride chemistry, along with propan-2-ol (1882 mL, 2.46E+04 mmol) and the mixture was stirred until full dissolved. Dissolution was endothermic (-4 °C). In a 4 L Erlenmeyer flask, previously etched using fluoride chemistry, potassium fluoride hydrofluoride (538 g, 6891 mmol) was dissolved in water
- 25 (2306 mL, 1.28E+05 mmol) to form a 3M solution. The dissolution was endothermic (-12 °C). The solution was then filtered to remove a small amount of insoluble material from the KHF₂. Once both solutions were fully dissolved, the contents of the Erlenmeyer flask were charged into the single walled flask portion-wise over 15 minutes. A moderate exotherm was observed (+10 °C). The solution became a thick and translucent semi-

opaque gray slurry during the addition and stirring was increased to keep the contents well mixed. The mixture was stirred for 1.5 h, and then filtered through a coarse glass fritted funnel (4 L, previously etched). The filtration required 30-45 minutes to complete. The clear biphasic filtrate was discarded. The white solids were dried for 10 minutes on the filter (cracking of the cake was observed). The solids were transferred back into a cleaned 5 L 3-neck single walled flask and re-slurried with water (1330 mL, 7.38E+04 mmol). The slurry was stirred for 2 h after which time it formed a clear homogenous hydrogel. The solution was stirred for another 1 h whereupon the solids/gel were filtered out using a 4 L coarse glass funnel (previously etched). The solids were allowed to dry on the filter for 30 minutes. The solids were transferred back to a cleaned 5 L 3-neck single walled flask and reslurried in acetone (1084 mL, 1.48E+04 mmol). The white/gray slurry was stirred for 1 h and was then filtered on a 4 L coarse glass funnel (previously etched). The filtration required 20 minutes to complete, and was then dried on the funnel for another 1 h. During this time, the solids were occasionally agitated to ensure homogenous drying. A light white powder remained after drying on the filter. The solids were dried for 20 h at 55 °C under vacuum with a slow nitrogen bleed to afford a fluffy white solid (200.3 g were collected).

To a stirred solution of 6-benzyl 5-(tert-butyl) (S)-3-benzyl-2-(6-bromo-1H-indazol-3-yl)-3,4,6,7-tetrahydro-5H-imidazo[4,5-c]pyridine-5,6-dicarboxylate (**I-15**) (10.0 g, 16.0 mmol) in 2-methyl tetrahydrofuran (100 mL, 10 vol) was added (4-(benzyloxy)-2-ethylphenyl)trifluoro- λ^4 -borane, potassium salt (**I-5**) (8.0 g, 20 mmol) and the fluffy white solid obtained above (0.20 g). The resulting reaction mixture was degassed with nitrogen gas for 30 minutes. To this solution, a prepared aqueous solution of cesium carbonate (20.0 g, 62.0 mmol in 60 mL water, 6 vol) was added. The resulting reaction mixture was further degassed for 15 minutes followed by addition of bis(di-tert-butyl(4-dimethylaminophenyl)phosphine)dichloropalladium(II) (0.66 g, 0.93 mmol), and the reaction mixture was evacuated under vacuum and flushed by nitrogen. The resulting reaction mixture was heated at 110°C for 20 hours. After completion of the reaction (TLC & LCMS monitoring), the resulting reaction mixture was cooled to room temperature and filtered through a celite bed, then further washed with EtOAc (3 x 0.5 L). The combined organics were washed with 1N sodium hydroxide solution (3 x 0.5 L). The combined organics were then washed with brine and dried over sodium sulfate, filtered, and evaporated under reduced pressure to yield the crude product, which was purified by

column chromatography over silica gel (100-200M) by using eluents 20% EtOAc in hexane to obtain the desired product (**I-16**) (as mixture of N-benzyl regioisomers) as light yellow solid (8.0 g, 66%). (m/z): [M+H]⁺ calcd for C₄₈H₄₇N₅O₅ 774.36 found 774.59.

Biological Assays

The compounds of the disclosure have been characterized in one or more of the following biological assays.

Assay 1: Biochemical JAK Kinase Assays

A panel of four LanthaScreen JAK biochemical assays (JAK1, 2, 3 and Tyk2) were carried in a common kinase reaction buffer (50 mM HEPES, pH 7.5, 0.01% Brij-35, 10 mM MgCl₂, and 1 mM EGTA). Recombinant GST-tagged JAK enzymes and a GFP-tagged STAT1 peptide substrate were obtained from Life Technologies.

Serially diluted compounds were pre-incubated with each of the four JAK enzymes and the substrate in white 384-well microplates (Corning) at ambient temperature for 1h. ATP was subsequently added to initiate the kinase reactions in 10 μ L total volume, with 1% DMSO. The final enzyme concentrations for JAK1, 2, 3 and Tyk2 are 4.2 nM, 0.1 nM, 1 nM, and 0.25 nM respectively; the corresponding K_m ATP concentrations used are 25 μ M, 3 μ M, 1.6 μ M, and 10 μ M; while the substrate concentration is 200 nM for all four assays. Kinase reactions were allowed to proceed for 1 hour at ambient temperature before a 10 μ L preparation of EDTA (10mM final concentration) and Tb-anti-pSTAT1 (pTyr701) antibody (Life Technologies, 2 nM final

concentration) in TR-FRET dilution buffer (Life Technologies) was added. The plates were allowed to incubate at ambient temperature for 1h before being read on the EnVision reader (Perkin Elmer). Emission ratio signals (520nm/495nm) were recorded and utilized to calculate the percent inhibition values based on DMSO and background controls.

For dose-response analysis, percent inhibition data were plotted vs. compound concentrations, and IC_{50} values were determined from a 4-parameter robust fit model with the Prism software (GraphPad Software). Results were expressed as pIC_{50} (negative logarithm of IC_{50}) and subsequently converted to pK_i (negative logarithm of dissociation constant, K_i) using the Cheng-Prusoff equation.

Test compounds having a lower K_i value or higher pK_i value in each of the four JAK assays show greater inhibition of JAK activity.

Assay 2: Inhibition of IL-2 Stimulated pSTAT5 in Tall-1 T cells

The potency of test compounds for inhibition of interleukin-2 (IL-2) stimulated STAT5 phosphorylation was measured in the Tall-1 human T cell line (DSMZ) using AlphaLisa. Because IL-2 signals through JAK1/3, this assay provides a measure of JAK1/3 cellular potency.

Phosphorylated STAT5 was measured via the AlphaLISA SureFire Ultra pSTAT5 (Tyr694/699) kit (PerkinElmer).

Human T cells from the Tall-1 cell line were cultured in a 37°C, 5% CO₂ humidified incubator in RPMI (Life Technologies) supplemented with 15% Heat Inactivated Fetal Bovine Serum (FBS, Life Technologies), 2mM Glutamax (Life Technologies), 25mM HEPES (Life Technologies) and 1X Pen/Strep (Life Technologies). Compounds were serially diluted in DMSO and dispensed acoustically to empty wells. Assay media (phenol red-free DMEM (Life Technologies) supplemented with 10% FBS (ATCC)) was dispensed (4 µL/well) and plates shaken at 900rpm for 10 mins. Cells were seeded at 45,000 cells/well in assay media (4 µL/well), and incubated at 37°C, 5% CO₂ for 1 hour, followed by the addition of IL-2 (R&D Systems; final concentration 300 ng/mL) in pre-warmed assay media (4 µL) for 30 minutes. After cytokine stimulation, cells were lysed with 6ul of 3x AlphaLisa Lysis Buffer (PerkinElmer) containing 1x PhosStop and Complete tablets (Roche). The lysate was shaken at 900rpm for 10 minutes at room temperature (RT). Phosphorylated STAT5 was measured via the pSTAT5 AlphaLisa kit (PerkinElmer). Freshly prepared acceptor bead

mixture was dispensed onto lysate (5 μ L) under green filtered <100 lux light. Plates were shaken at 900rpm for 2mins, briefly spun down, and incubated for 2hrs at RT in the dark. Donor beads were dispensed (5 μ L) under green filtered <100 lux light. Plates were shaken at 900rpm for 2 minutes, briefly spun down, and incubated overnight at RT in the dark. Luminescence was measured with excitation at 689 nm and emission at 570 nm using an EnVision plate reader (PerkinElmer) under green filtered <100 lux light.

To determine the inhibitory potency of test compounds in response to IL-2, the average emission intensity of beads bound to pSTAT5 was measured in a human T cell line. IC₅₀ values were determined from analysis of the inhibition curves of signal intensity versus compound concentration. Data are expressed as pIC₅₀ (negative decadic logarithm IC₅₀) values (mean $\pm$ standard deviation).

Assay 3: Murine (Mouse) model of IL-13 induced pSTAT6 induction in lung tissue

IL-13 is an important cytokine underlying the pathophysiology of asthma (Kudlacz et al. *Eur. J. Pharmacol.*, **2008**, 582,154-161). IL-13 binds to cell surface

5 receptors activating members of the Janus family of kinases (JAK) which then phosphorylate STAT6 and subsequently activates further transcription pathways. In the described model, a dose of IL-13 was delivered locally into the lungs of mice to induce the phosphorylation of STAT6 (pSTAT6) which is then measured as the endpoint.

Adult Balb/c mice from Harlan were used in the assay. On the day of study,
10 animals were lightly anesthetized with isoflurane and administered either vehicle or test compound (1 mg/mL, 50 μ L total volume over several breaths) via oral aspiration. Animals were placed in lateral recumbency post dose and monitored for full recovery from anesthesia before being returned to their home cage. Four hours later, animals were once again briefly anesthetized and challenged with either vehicle or IL-13 (0.03 μ g total
15 dose delivered, 50 μ L total volume) via oral aspiration before being monitored for recovery from anesthesia and returned to their home cage. One hour after vehicle or IL-13 administration, whole blood and lungs were collected for both pSTAT6 detection in lung homogenates using a Perkin Elmer AlphaLISA® SureFire® Ultra™ HV p-STAT6 (Tyr641) assay kit and for total drug concentration analysis in both lung and plasma.
20 Blood samples were centrifuged (Eppendorf centrifuge, 5804R) for 4 minutes at approximately 12,000 rpm at 4°C to collect plasma. Lungs were rinsed in DPBS (Dulbecco's Phosphate-Buffered Saline), padded dry, flash frozen, weighed, and homogenized at a dilution of 1:3 in 0.1% formic acid in HPLC water. Plasma and lung levels of test compound were determined by LC-MS analysis against analytical standards
25 constructed into a standard curve in the test matrix. A lung to plasma ratio was determined as the ratio of the lung concentration in ng/g to the plasma concentration in ng/mL at 5 hours.

Activity in the model is evidenced by a decrease in the level of pSTAT6 present in the lungs of treated animals at 5 hours compared to the vehicle treated, IL-13 challenged
30 control animals. The difference between the control animals which were vehicle- treated, IL-13 challenged and the control animals which were vehicle-treated, vehicle challenged dictated the 0% and 100% inhibitory effect, respectively, in any given experiment. The

compounds tested in the assay exhibited inhibition of STAT6 phosphorylation at 5 hours after IL-13 challenge as documented below.

Observation of significant concentration in compounds tested in the mouse lung confirmed that the observed inhibition of IL-13 induced pSTAT6 induction was a result of the activity of the test compound. The lung to plasma ratio at 5 hours showed that compounds 1 to 6 exhibited significantly more exposure in the lung than exposure in plasma in mice.

Assay 4: Inhibition of TSLP-Evoked TARC Release in Human Peripheral Blood Mononuclear Cells

Thymic stromal lymphopoietin (TSLP) and thymus and activation-regulated chemokine (TARC) are overexpressed in asthmatic airways, and correlate with disease severity. In the lungs, TSLP may be released by bronchial epithelial cells in response to allergens and viral infections. TSLP signals through an IL-7R α /TSLPR heterodimer

15

found in a broad range of tissues and cell types, including epithelial cells, endothelial cells, neutrophils, macrophages, and mast cells. The binding of TSLP to its receptor induces a conformational change that activates JAK1 and JAK2 to phosphorylate various transcription factors, including STAT3 and STAT5. In immune cells, this triggers a cascade of intracellular events that result in cell proliferation, anti-apoptosis, dendritic cell migration, and production of Th2 cytokines and chemokines. In peripheral blood mononuclear cells (PBMC), TSLP has a proinflammatory effect by activating myeloid dendritic cells to attract and stimulate T cells, a process mediated by the chemoattractant TARC.

10 In this assay, it was shown that TSLP stimulation induces TARC release from PBMCs, and that this response is attenuated in a dose-dependent manner upon treatment with compound. The potencies of the test compounds were measured for inhibition of TARC release.

PBMC aliquots (previously isolated from whole blood and frozen in aliquots at -
15 80°C) from 3 to 5 donors were thawed at 37°C and added dropwise to 40 mL pre-warmed, sterile-filtered, complete RPMI media in 50 mL Falcon tubes. Cells were pelleted and resuspended in complete media at 2.24×10^6 cells/mL. Cells were seeded at 85 μ L (190,000 cells) per well in a tissue culture treated 96-well flat bottom microplate. Cells were allowed to rest for 1 hour at 37°C with 5% CO₂.

20 Compounds were received as 10 mM stock solutions in DMSO. 3.7-fold serial dilutions were performed to generate 9 concentrations of test compound in DMSO at 300X the final assay test concentration. 150-fold intermediate dilutions were performed in complete media to generate compound at 2X the final assay test concentration with 0.2% DMSO. After the 1 hour rest period, 95 μ L of 2X compound was added to each
25 well of PBMC, for a final assay concentration range of 33.33 μ M to 0.95 μ M. 95 μ L of 0.2% DMSO in complete media was added to the untreated control wells. Cells were pre-treated with compound for 1 hour at 37°C with 5% CO₂ prior to stimulation.

Recombinant human TSLP protein was reconstituted at 10 μ g/mL in sterile DPBS with 0.1% BSA and stored in aliquots at -20°C. Immediately prior to use, an aliquot was
30 thawed and prepared at 20X the final assay concentration in complete media. 10 μ L of 20X TSLP was added to each well of PBMC, for a final assay concentration of 10 ng/mL. 10 μ L of complete media was added to the unstimulated control wells. Cells were stimulated in the presence of compound for 48 hours at 37°C with 5% CO₂.

Following stimulation, the cell culture supernatants were harvested and TARC levels were detected by enzyme-linked immunosorbent assay (ELISA), using Human CCL17/TARC Quantikine ELISA Kit (R&D Systems #DDN00) according to the manufacturer's instructions.

- 5 For dose response analysis, the log [test compound (M)] was plotted versus the percent response values for each donor, and IC₅₀ values were determined using a nonlinear regression analysis with GraphPad Prism Software using the 4-parameter sigmoidal dose-response algorithm with variable slope. Data are expressed as mean pIC₅₀ (negative decadic logarithm IC₅₀) values calculated from pIC₅₀ values of individual
10 donors and rounded to one decimal place. The potency values for inhibition are summarized in Table 3.
