

DATA PROCESSING METHOD AND APPARATUS IN ARTIFICIAL INTELLIGENCE SYSTEM

ABSTRACT

For a problem that costs of matching a new data format by a current artificial intelligence system are high, an artificial intelligence system and a corresponding data processing method and apparatus are provided, to perform, based on an artificial intelligence task from a user, format conversion on input data corresponding to the artificial intelligence task, so that a data format used by the artificial intelligence system for processing the artificial intelligence task can be extended with low costs, and the artificial intelligence system can select a proper data format to process the artificial intelligence task. Therefore, efficiency and an application scope of the artificial intelligence system are increased.
