# ABSTRACT

## USE OF SEMAPHORIN-4D INHIBITORY MOLECULES IN COMBINATION WITH AN IMMUNE MODULATING THERAPY TO INHIBIT TUMOR GROWTH AND METASTASES

Provided herein are methods for inhibiting, delaying, or reducing tumor growth and metastases of plexin-B1-expressing cancer cells in a subject, comprising administering to the subject an effective amount of an isolated binding molecule which specifically binds to semaphorin-4D (SEMA4D) in combination with an effective amount of at least one other immune modulating therapy.
