# IMAGE PROCESSING APPARATUS AND METHOD

## ABSTRACT

The present disclosure relates to an image processing apparatus and method that enable a specification of a bitstream to correspond to a profile more reliably.

In a case where a predetermined condition is satisfied, a moving image as an encoding target is encoded with a picture type of all pictures set as an I-picture. Furthermore, a bitstream of a moving image as a decoding target is decoded, and it is checked whether the picture type of all pictures of the moving image is the I-picture in the bitstream in a case where a predetermined condition is satisfied. The present disclosure can be applied to, for example, an image processing apparatus, an image processing method, or the like.
