

TITLE OF INVENTION: ELECTRIC FOLDING WAGON CAPABLE OF BEING DRIVEN

ABSTRACT

An electric folding wagon capable of being driven, the electric folding wagon comprising a folding wagon body (10), a control assembly (20) and a steering rod assembly (30). The bottom of the tail end of the folding wagon body (10) is provided with follower wheels (13); the control assembly (20) is arranged on the folding wagon body (10); the steering rod assembly (30) comprises a control rod (31), wherein the bottom end of the control rod (31) is connected to a driving wheel assembly (40), and the bottom end of the control rod (31) is also connected to a pedal rod assembly (50); one end of the pedal rod assembly (50) away from the control rod (31) is connected to the front end of the folding wagon body (10); and the driving wheel assembly (40) is electrically connected to the control assembly (20). By means of the arrangement of the pedal rod assembly (50) and the steering rod assembly (30) at the front end of the folding wagon body (10), the folding wagon body (10) has the functions of electric human-carrying and goods-carrying driving, electric power-assisted towing and folded storage, and has the characteristics of light portability and convenient movement, so as to satisfy the use requirements of various scenarios; the steering rod assembly (30) can change the use form according to the use requirements, such that the practicability is improved; and both the pedal rod assembly (50) and the steering rod assembly (30) can be folded and are collapsible, such that the amount of space occupied is reduced, thereby further improving the practicability.
