

ABSTRACT

The packaged compressor 2 includes inside a package 6: a compressor main body 8 compressing air; a cooling fan 4; a fan cover 10 attached to the cooling fan 4 and opened to a suction side and to an upward direction being a delivery side of the cooling fan 4; an exhaust duct 12 provided above a delivery side opening 10a of the fan cover 10 and extending in a vertical direction; and an air-cooled heat exchanger 14 arranged to be inclined with respect to a vertical direction inside the exhaust duct 12 and configured to exchange heat between air compressed by the compressor main body 8 and air delivered by the cooling fan 4. Thus, the packaged compressor 2 can be reduced in noise and downsized.
