

Abstract

The present invention discloses a method for a wastewater treatment and the treatment system thereof, and a method for the preparation of a
5 molecular sieve and the molecular sieve preparation system. The wastewater treatment method of the present invention comprises an electrodialysis treatment of the wastewater to obtain desalted water having a reduced content of organic ammonium ion and an alkali liquor containing an organic ammonium ion, wherein the electrodialyser used in the
10 electrodialysis has at least one membrane unit, and at least a part of the membrane unit comprises a cation exchange membrane. The method for wastewater treatment and the system thereof in the present invention can effectively reduce the content of the organic ammonium ion in the wastewater and thereby reduce the COD value of the wastewater. Both the
15 recovered organic ammonium ion and the produced desalted water can be recycled when the wastewater containing the organic ammonium ion from the production of a molecular sieve is treated using the present method, as realizes an effective reuse of resources.
