

REAL-TIME SHARED DISK SYSTEM FOR COMPUTER CLUSTERS
ABSTRACT OF THE DISCLOSURE

A clustered computer system (10) includes a shared data storage system (16), preferably a virtually shared disk (VSD) memory system, to which the computers (1-4) in the cluster write data and from which the computers (1-4) read data, using data access requests. The data access requests can be associated with deadlines, and individual storage devices (1-4) in the shared storage system (16) satisfy competing requests based on the deadlines of the requests. The deadlines can be updated and requests can be killed, to facilitate real time data access for, e.g., multimedia applications such as video on demand.
