Bed for Pressure Relaxation and Body Trimming

G00002

ABSTRACT

A bed for pressure relaxation and body trimming mainly has a bed (1) provided for an user to lie down comfortably, a pressure source (2) of an air compressor disposed in the space on the bottom portion of the bed (1), an air bag assembly (4) including a plurality of air bags cooperating with respective pipelines (21) installed on the bags (46) inside the air bags to connect with the pressure source (2) and a control unit (3) disposed on a proper position on the bed (1) for setting and controlling the actions of the pressure source and all the pipelines. The user comfortably lies down on the bed and wears the air bags on the body parts according to the practical needs. The operating panel board (3) of the control unit sets the required pressing method, pressure value and functional time. After it is activated, a control circuit (32) of the control unit precisely controls the actions of the bags in the air bags allowing the user to completely relax so as to obtain sufficient mental and physical rest.
