ABSTRACT OF THE DISCLOSURE

Abnormality determination of eyeball illumination is performed by a computer on the basis of the output level, i.e., lightness of a cornea reflection image.

5 When an abnormality is determined, a display indicating it is made and a warning is given. At the same time, power supply for eyeball illumination is stopped. The abnormality determination of eyeball illumination is performed by comparing the output level of a cornea
10 reflection image with a predetermined reference value or comparing the output level ratio or difference of the cornea reflection image with a predetermined reference value.
