ABSTRACT

A method and an apparatus for data processing, a device, a medium, and a product. The method comprises: obtaining (S401) multiple groups of transaction data which are to be processed; determining (S402) at least one group of first transaction data meeting a preset condition from the multiple groups of transaction data according to a result of executing each group of transaction data; packaging (S403) the multiple groups of transaction data to generate a consensus-pending block, where each group of first transaction data and at least one group of second transaction data are recorded in the consensus-pending block recording, and the second transaction data is among the multiple groups of transaction data other than the first transaction data; and verifying (S404) the first transaction data through first consensus processing and verifying the second transaction data through second consensus processing, which is different from the first consensus processing.
