

Title of Invention: Doggie's Shoes

The doggies in our world have four soft bottom legs, when their legs contact with the floor, the soften part of the skin or flesh will contact the rough surface of the ground. So there might be some sharp edges, cigarette butts or broken glasses on the ground and grass lands. Therefore it will cuts and burns their flesh of their legs.

The design of two pair of shoes for the doggies, is to protect them from injuries when they carry out their duties, for example patrolling for the army or the police force. It consist of three holes to let the three paws to stick out of the shoes, for ventilation and prevent from injuries when wearing it. There will be a fastening to secure the shoes on doggies legs firmly, and the tract on the bottom of the shoe which can prevent doggies to slip during running in the raining day or snowy road.
