

CEILING FAN

ABSTRACT

A ceiling fan of the present disclosure includes a strut, a motor unit, blade support (4) that is rotated by the motor unit, a plurality of blade parts fixed to blade support (4) and extending in a lateral direction, an upper cover, a discharge product generator, and lower cover (7) having a bowl shape opening upward disposed below the plurality of blade parts and covering the discharge product generator. Blade support (4) includes an annular part that is rotated by the motor unit, and a support part to which the plurality of blade parts extending outward from the annular part are fixed. Blade support (4) is configured to be covered with lower cover (7) when viewed from below. Lower cover (7) includes inner cover (34) in a bowl shape opening downward. The discharge product generator is disposed in an annular gap between an outer surface of inner cover (34) and an inner surface of lower cover (7).
