

UNIMODAL POLYETHYLENE COPOLYMER AND FILM THEREOF

FIELD

[0001] Polyethylene copolymers, films, manufactured articles, and related methods.

INTRODUCTION

[0002] Patent applications and patents in or about the field include US 2016/0068623 A1; US 2016/0297907 A1; WO 2017/132092 A1; US 6,989,344 B2; US 7,078,467 B1; US 7,157,531 B2; US 7,223,825 B2; US 7,300,988 B2; US 8,227,552 B2 and US 8,497,329 B2.

[0003] Bubble instability in blown polyethylene film extrusion can create one or more problems with: (a) film dimension changes such as variations in film gauge (thickness) and/or width; (b) loss of film integrity such as scratches and/or tears in the film; and (c) film misbehaviors such as sagging, twisting or fluttering.

SUMMARY

[0004] A unimodal ethylene-*co*-1-hexene copolymer that, when in melted form at 190 degrees Celsius (° C.), is characterized by a unique melt property space defined by a combination of melt elasticity and complex viscosity ratio (shear thinning) properties (“the unimodal ethylene-*co*-1-hexene copolymer”). The unimodal ethylene-*co*-1-hexene copolymer is useful for making a film with enhanced bubble stability (“the unimodal ethylene-*co*-1-hexene copolymer”). Enhanced bubble stability means decreased bubble instability, alternatively increased bubble stability.

[0005] A method of synthesizing the unimodal ethylene-*co*-1-hexene copolymer, the method consisting essentially of polymerizing ethylene (monomer) and 1-hexene (comonomer) with a single unimodal catalyst system in a single fluidized-bed, gas phase polymerization (FB-GPP) reactor under effective operating conditions, thereby making the unimodal ethylene-*co*-1-hexene copolymer. The “consisting essentially of” transitional phrase means the method is free of other catalysts (i.e., is free of a multimodal or bimodal catalyst system or two or more separate catalysts), the polymerizing is carried out in a single reactor (i.e., in the FB-GPP reactor), and the operating conditions are effective for imparting the unique combination of melt elasticity and complex viscosity ratio (shear thinning) properties to the unimodal ethylene-*co*-1-hexene copolymer. Otherwise, the method’s constituents and operating conditions are not limited.

[0006] A film consisting essentially of the unimodal ethylene-*co*-1-hexene copolymer (“the film”). The film is characterized by enhanced bubble stability. The “consisting essentially of” transitional phrase means the film, when embodiments are characterized by bubble stability, is free of other polyolefin polymers, but otherwise its constituents are not particularly limited.

[0007] A method of making a blown film, the method comprising melting the unimodal ethylene-co-1-hexene copolymer to give a melt thereof, extruding the melt through a die configured for forming a bubble so as to make a bubble of the unimodal ethylene-co-1-hexene copolymer, and blowing (inflating) the bubble with a film-blowing machine, thereby making the blown film. The blown film is characterized by enhanced bubble stability (decreased bubble instability). The blown film, when embodiments are characterized by bubble stability, is free of other polyolefin polymers, but otherwise its constituents are not particularly limited.

[0008] A manufactured article comprising the unimodal ethylene-co-1-hexene copolymer.

BRIEF DESCRIPTION OF THE DRAWING

[0009] Figure 1 (FIG. 1) is a plot of melt property spaces defined by melt viscosity on the y-axis versus shear thinning on the x-axis.

DETAILED DESCRIPTION

[0010] The Summary and Abstract are incorporated here by reference. Certain embodiments are described below as numbered aspects for easy cross-referencing.

[0011] Aspect 1. A unimodal ethylene-co-1-hexene copolymer that, when in melted form at 190° C., is characterized by a melt property space defined by a combination of melt elasticity and complex viscosity ratio (shear thinning) properties, wherein the combination is defined according to equation 1 (Eq. 1): $6 \cdot \text{SH1000} + 1,721 < G' (G''=3,000 \text{ Pa}) < 6 \cdot \text{SH1000} + 1,828$ (Eq. 1); wherein < is less than; * is multiplication; + is addition; $G' (G''=3,000 \text{ Pa})$ is melt elasticity in Pascals (Pa) measured according to Melt Storage Modulus Test Method (described herein) at loss modulus $G'' = 3000$ pascals; SH1000 is a complex viscosity ratio (shear thinning) equal to $\text{Eta} \cdot 0.126 / \text{Eta} \cdot 126$, wherein $\text{Eta} \cdot 0.126$ is complex viscosity in pascal-seconds (Pa-s) measured at 0.126 radian per second (rad/s) by Dynamic Mechanical Analysis Test Method (described herein); and $\text{Eta} \cdot 126$ is complex viscosity in Pa-s measured at 126 rad/s by the Dynamic Mechanical Analysis Test Method. $\text{Eta} \cdot 0.126$ may be called $(\eta^*)_{0.126}$, $\text{Eta} \cdot 126$ called $(\eta^*)_{126}$, and $\text{SH1000} = (\eta^*)_{0.126} / (\eta^*)_{126}$. Dynamic mechanical analysis (DMA) is also known as dynamic mechanical spectroscopy (DMS). In some embodiments the unimodal ethylene-co-1-hexene copolymer has a high load melt index (I_{21}) from 15.0 to 25.0 grams per 10 minutes (g/10 min.), alternatively 17 to 23 g/10 min.; a melt flow ratio (MFR5 or I_{21}/I_5) from 18.0 to 25.0, alternatively 20.0 to 23.0; a molecular mass dispersity (M_w/M_n), $\bar{M}_w$, from 25.0 to 45.0, alternatively 28.0 to 38.4; and a SH1000 from 30.0 to 50.0, alternatively from 32.0 to 45.0.

[0012] Aspect 2. The unimodal ethylene-co-1-hexene copolymer of aspect 1 further characterized by at least one of properties (a) to (g): (a) a density from 0.935 to 0.945 gram

per cubic centimeter (g/cm^3), alternatively from 0.936 to 0.942 g/cm^3 , alternatively from 0.938 to 0.940 g/cm^3 , alternatively from 0.938.5 to 0.940.4 g/cm^3 , measured according to ASTM D792-13, Method B; (b) a high load melt index (I_{21}) from 17.5 to 22.6 grams per 10 minutes (g/10 min.), alternatively from 21.05 to 22.54 g/10 min. measured according to ASTM D1238-13 (190° C., 21.6 kg); (c) a melt flow ratio (MFR_5 or I_{21}/I_5) from 20.1 to 22.9, alternatively from 20.15 to 22.84, wherein I_{21} is measured according to ASTM D1238-13 (190° C., 21.6 kg) and I_5 is melt index in g/10 min. measured according to ASTM D1238-13 (190° C., 5.0 kg); (d) a molecular mass dispersity (M_w/M_n), $\bar{M}_w$, from 28.9 to 38.7, alternatively from 28.95 to 38.74, wherein M_w and M_n are measured according to the GPC Test Method; (e) wherein the combination of melt elasticity and complex viscosity ratio (shear thinning) properties is defined according to equation 1a (Eq. 1a): $\text{Eq. 1a: } 6 \cdot \text{SH1000} + 1,726 < G' (G''=3,000 \text{ Pa}) < 6 \cdot \text{SH1000} + 1,824$ (Eq. 1a); (f) a complex viscosity Eta^*_{126} from 1270 to 1460 pascal-seconds (Pa-s), alternatively from 1280.0 to 1454 Pa-s measured at 126 radians per second by the Dynamic Mechanical Analysis Test Method; and (g) the complex viscosity ratio (shear thinning) SH1000 is from 33.6 to 42.0, alternatively from 33.65 to 41.14.

[0013] Aspect 3. The unimodal ethylene-co-1-hexene copolymer of aspect 2 further defined by any one of limitations (i) to (xi): (i) properties (a) and (b); (ii) properties (a) and (c); (iii) properties (a) and (d); (iv) properties (a) and (e); (v) properties (a) and (f); (vi) properties (a) and (g); (vii) properties (a), (b), and (c); (viii) properties (a), (b), and (d); (ix) properties (f) and (g); (x) any six of properties (a) to (g); and (xi) each of properties (a) to (g).

[0014] Aspect 4. The unimodal ethylene-co-1-hexene copolymer of any one of aspects 1 to 3 further characterized by any one of properties (h) to (i), or a combination of properties (h) and (i): (h) a weight-average molecular weight (M_w) from 200,000.0 to 300,000.0 grams per mole (g/mol), alternatively 250,000.0 to 299,400.0 g/mol , alternatively 260,000.0 to 299,000.0 g/mol , measured according to the Gel Permeation Chromatography (GPC) Test Method; and (i) a number-average molecular weight (M_n) from 7,600.0 to 10,000.0 g/mol , alternatively 7,650 to 9,400.0 g/mol , measured according to the GPC Test Method. Some embodiments combine properties (a) and (b) of aspect 2 with property (h) of aspect 4; alternatively combine properties (a) and (d) of aspect 2 with property (h) of aspect 4; alternatively combine properties (a), (b) and (d) of aspect 2 with property (h) of aspect 4.

[0015] Aspect 5. A method of synthesizing the unimodal ethylene-co-1-hexene copolymer of any one of aspects 1 to 4, the method consisting essentially of contacting ethylene and 1-hexene with a single catalyst system consisting of a unimodal chromium catalyst system in a single fluidized bed, gas-phase polymerization (FB-GPP) reactor under effective operating

conditions comprising a reactor bed temperature (RBT), an average polymer residence time (avgPRT), and an ethylene partial pressure (C2P) and receiving an ethylene (C₂) feed, a comonomer (1-hexene or "C₆") feed, a hydrogen (H₂) feed, and, optionally, an oxygen (O₂) feed wherein the feeds are characterized by a H₂/C₂ gas molar ratio (H₂/C₂), a comonomer/ethylene gas molar ratio ("C₆/C₂"), and a O₂/C₂ gas volume ratio ("[O₂/C₂]", vol/vol in ppmv); wherein RBT is from 101° to 111° C.; avgPRT is from 1.70 to 3.10 hours, C2P is from 1,100 to 1,900 kilopascals (kPa); H₂/C₂ gas molar ratio is from 0.05 to 0.150; C₆/C₂ gas molar ratio is from 0.010 to 0.021; and O₂/C₂ gas volume ratio is from > 0 to 130 parts per billion volume/volume (ppbv); thereby synthesizing the unimodal ethylene-co-1-hexene copolymer in the FB-GPP reactor. The method may be characterized by any one of limitations (i) to (ix): (i) the RBT is from 104.0° to 110.0° C., alternatively from 105.0° to 109.0° C.; (ii) the C2P is from 1,300 to 1,500 kPa, alternatively 1,375 to 1,384 kPa; (iii) the H₂/C₂ gas molar ratio is from 0.90 to 0.150, alternatively from 0.095 to 0.144; (iv) the C₆/C₂ gas molar ratio is from 0.0100 to 0.0165, alternatively from 0.0105 to 0.0163; (v) the O₂/C₂ gas volume ratio is from 10 to 120 ppbv, alternatively from 35 to 117 ppbv; (vi) both (i) and (iii); (vii) each of (i), (iii), and (iv); (viii) any four of (i) to (v); and (ix) each of (i) to (v). The RBT may be adjusted within its above range to adjust the $\overline{M}_n$ (M_w/M_n) within its above range, and thus the SH1000 within its above range, of the unimodal ethylene-co-1-hexene copolymer made by the method. The RBT and H₂/C₂ gas molar ratio may be adjusted within their above ranges to adjust melt elasticity of the unimodal ethylene-co-1-hexene copolymer made by the method. The H₂/C₂ gas molar ratio, C₆/C₂ gas molar ratio, and O₂/C₂ gas volume ratio are determined by measuring (e.g., metering) the amounts of H₂, C₂, C₆ and O₂ gases being fed into the FB-GPP reactor. The reactor bed temperature RBT and the H₂/C₂ gas molar ratio are useful in the method of synthesizing the unimodal ethylene-co-1-hexene copolymer that, when in melt form at 190° C., satisfies Eq. 1 described earlier. The "consisting essentially of" transitional phrase means the method is free of other catalysts (i.e., is free of a multimodal or bimodal catalyst system or two or more separate catalysts), the polymerizing is carried out in a single reactor (i.e., in the FB-GPP reactor), and the operating conditions are effective for imparting the unique combination of melt elasticity and complex viscosity ratio (shear thinning) properties to the unimodal ethylene-co-1-hexene copolymer. Other than that, the method's constituents and operating conditions are not particularly limited. The unimodal chromium catalyst system and its preparation are described herein. The unimodal chromium catalyst system may be a reduced chromium

oxide catalyst system, which along with its preparation are described herein. The reduced chromium oxide catalyst system may be ACCLAIM™ K-100 advanced chrome catalyst (described herein), available from Univation Technologies LLC, Houston, Texas, USA.

[0016] Aspect 6. The method of aspect 5 further comprising removing the unimodal ethylene-co-1-hexene copolymer from the FB-GPP reactor to give a removed unimodal ethylene-co-1-hexene copolymer. In some aspects the removed unimodal ethylene-co-1-hexene copolymer may be purged with an inert gas (e.g., N₂) to remove entrained hydrocarbons therefrom and/or treated with a stream of humidified nitrogen (N₂) gas to deactivate *in situ* any residual amount of the reduced chromium oxide catalyst system therein. In some aspects the removed unimodal ethylene-co-1-hexene copolymer is pelletized to give pellets of the removed unimodal ethylene-co-1-hexene copolymer. In some aspects the removed unimodal ethylene-co-1-hexene copolymer may be combined with one or more film additives useful in polyethylene films. The combining may comprising melt mixing the one or more film additives into a melt of the removed unimodal ethylene-co-1-hexene copolymer. Alternatively the combining may comprise soaking or injecting the one or more film additives into the pellets of the removed unimodal ethylene-co-1-hexene copolymer.

[0017] Aspect 7. A manufactured article comprising the unimodal ethylene-co-1-hexene copolymer of any one of aspects 1 to 4.

[0018] Aspect 8. A film consisting essentially of the unimodal ethylene-co-1-hexene copolymer of any one of aspects 1 to 4 ("the film"). The "consisting essentially of" transitional phrase means the film is free of other polyolefin polymers, but otherwise its constituents are not particularly limited. The film may be used in packaging applications to protect a substance in need of covering, wherein the film is disposed to at least partially cover the substance. Examples of substances in need of covering are paper, paperboard (e.g., cardboard), food, pharmaceutical compounds, and a stack of paperboard boxes (e.g., wherein the film is a shrink wrap used for wrapping a pallet stacked with paperboard boxes). In some aspects the film is a blown film made as described below.

[0019] Aspect 9. A method of making a blown film, the method comprising melting the unimodal ethylene-co-1-hexene copolymer of any one of aspects 1 to 4 so as to give a melt thereof, extruding the melt through a die configured for forming a bubble so as to make a bubble of the unimodal ethylene-co-1-hexene copolymer, and blowing (inflating) the bubble with a film-blowing machine, thereby making the blown film, which is restricted in one dimension. The bubble is restricted in one dimension. The blown film may be made or fabricated without internal bubble cooling (IBC) by any suitable method, including high stalk

film blowing without IBC, such as by using a high stalk film blowing manufacturing line without (active) IBC equipment. The blown film consists essentially of the unimodal ethylene-*co*-1-hexene copolymer of any one of aspects 1 to 4 (“the blown film”). The “consisting essentially of” transitional phrase means the blown film is free of other polyolefin polymers, but otherwise its constituents are not particularly limited.

[0020] Aspect 10. A blown film made by the method of aspect 9 and consisting essentially of the unimodal ethylene-*co*-1-hexene copolymer of any one of aspects 1 to 4 (“the blown film”). The “consisting essentially of” transitional phrase means the blown film is free of other polyolefin polymers, but otherwise its constituents are not particularly limited. The blown film is characterized by enhanced (increased) bubble stability, i.e., decreased bubble instability. The blown film optionally may contain zero, one or more of the film additives. The blown film may be characterized by enhanced (increased) toughness and/or enhanced bubble stability (decreased bubble instability). The blown film may be used in the packaging applications.

[0021] The unimodal ethylene-*co*-1-hexene copolymer may be generally described as a medium molecular weight medium density polyethylene (MMW MDPE).

[0022] The unimodal ethylene-*co*-1-hexene copolymer, films, and method of making the unimodal ethylene-*co*-1-hexene copolymer are free of Ziegler-Natta catalysts, metallocene catalysts, and post-metallocene catalysts. E.g., free of Ti, Hf, Zr metals.

Definitions

[0023] As used herein, bubble stability is measured according to the methods described herein.

[0024] Catalyst. A material that enhances rate of a reaction (e.g., the polymerization of ethylene and 1-hexene) and is not completely consumed thereby.

[0025] Catalyst system. Combination of a catalyst *per se* and a companion material such as a modifier compound for attenuating reactivity of the catalyst, a support material on which the catalyst is disposed, a carrier material in which the catalyst is disposed, or a combination thereof, or a reaction product of a reaction of the catalyst *per se* and the companion material.

[0026] Consisting essentially of, consist(s) essentially of, and the like. Partially-closed ended expressions that exclude anything that would affect the basic and novel characteristics of that which they describe, but otherwise allow anything else. In some aspects any one, alternatively each “comprising” or “comprises” may be replaced by “consisting essentially of” or “consists essentially of”, respectively; alternatively by “consisting of” or “consists of”, respectively.

[0027] Consisting of and consists of. Closed ended expressions that exclude anything that is not specifically described by the limitation that it modifies. In some aspects any one,

alternatively each expression “consisting essentially of” or “consists essentially of” may be replaced by the expression “consisting of” or “consists of”, respectively.

[0028] Dry. Generally, a moisture content from 0 to less than 5 parts per million based on total parts by weight. Materials fed to the reactor(s) during a polymerization reaction are dry.

[0029] Feeds. Quantities of reactants and/or reagents that are added or “fed” into a reactor. In continuous polymerization operation, each feed independently may be continuous or intermittent. The quantities or “feeds” may be measured, e.g., by metering, to control amounts and relative amounts of the various reactants and reagents in the reactor at any given time.

[0030] Film: an article restricted in one dimension. The restricted dimension may be called a thickness of the film, and the thickness is substantially uniform therein. Claimed film properties are measured on 13 (12.7) micrometers thick monolayer films.

[0031] Inert. Generally, not (appreciably) reactive or not (appreciably) interfering therewith in the inventive polymerization reaction. The term “inert” as applied to the purge gas or ethylene feed means a molecular oxygen (O_2) content from 0 to less than 5 parts per million based on total parts by weight of the purge gas or ethylene feed.

[0032] Internal bubble cooling or IBC is an aspect of film blowing performed by actively using ancillary, special purpose IBC equipment such as that of US 2002/0150648 A1 to R. E. Cree.

[0033] Metallocene catalysts. Substantially single site or dual site catalytic molecules based on metal-cyclopentadienyl ligand complexes.

[0034] Post-metallocene catalysts. Substantially single site or dual site catalytic molecules based on metal-ligand complexes wherein the ligand is a substituted cyclopentadienyl or multidentate molecular anion.

[0035] Unimodal. When referring to a polymer: having a single peak (no shoulder) in a plot of $dW/d\text{Log}(MW)$ on the y-axis versus $\text{Log}(MW)$ on the x-axis to give a Gel Permeation Chromatograph (GPC) chromatogram, wherein $\text{Log}(MW)$ and $dW/d\text{Log}(MW)$ are as defined herein and are measured by Gel Permeation Chromatograph (GPC) Test Method described herein. When referring to a catalyst or catalyst system: producing a unimodal polymer.

[0036] Ziegler-Natta catalysts. Heterogeneous materials that enhance olefin polymerization reaction rates and typically are prepared by contacting inorganic titanium compounds, such as titanium halides supported on a magnesium chloride support, with an activator.

[0037] Melt elasticity of a thermoplastic polymer can be thought of as the behavior of a melt of the polymer during a shaping process such as extrusion or film formation. It is one of the determinants of viscoelastic melt behavior, wherein viscosity decreases with increasing shear rate. Unsatisfactory melt elasticity may undesirably cause die swell during extrusion

or problems with bubble stability during film blowing. A measure of, or proxy for, melt elasticity used herein is a melt storage modulus (G') value that is measured using DMA (Dynamic Mechanical Analysis) on polymer melts at 190° C. by performing small-strain (10%) oscillatory shear at varying frequency from 0.02 radian per second (rad/s) to about 200 rad/s using an ARES-G2 Advanced Rheometric Expansion System, from TA Instruments, with parallel-plate geometry to obtain the G' ($G''=3,000$ Pa) value in pascals of melt storage modulus (G') at a dynamic frequency where loss modulus (G'') is equal to 3,000 Pascals.

[0038] In an illustrative pilot plant process for making the unimodal ethylene-co-1-hexene copolymer, a fluidized bed, gas-phase polymerization reactor ("FB-GPP reactor") having a reaction zone dimensioned as 304.8 mm (twelve inch) internal diameter and a 2.4384 meter (8 feet) in straight-side height and containing a fluidized bed of granules of the unimodal ethylene-co-1-hexene copolymer. Configure the FB-GPP reactor with a recycle gas line for flowing a recycle gas stream. Fit the FB-GPP reactor with gas feed inlets and polymer product outlet. Introduce gaseous feed streams of ethylene and hydrogen together with comonomer (e.g., 1-hexene) below the FB-GPP reactor bed into the recycle gas line. Control individual flow rates of ethylene (" C_2 "), hydrogen (" H_2 ") and 1-hexene or " C_6 ") to maintain a fixed comonomer to ethylene monomer gas molar ratio (C_X/C_2 , e.g., C_6/C_2) equal to a described value (e.g., 0.0050), a constant hydrogen to ethylene gas molar ratio (" H_2/C_2 ") equal to a described value (e.g., 0.0020), and a constant ethylene (" C_2 ") partial pressure equal to a described value (e.g., 1,000 kPa). Measure concentrations of all gases by an in-line gas chromatograph to understand and maintain composition in the recycle gas stream. Maintain a reacting bed of growing polymer particles in a fluidized state by continuously flowing a make-up feed and recycle gas through the reaction zone. Use a superficial gas velocity of 0.49 to 0.67 meter per second (m/sec) (1.6 to 2.2 feet per second (ft/sec)). Operate the FB-GPP reactor at a total pressure of about 2344 to about 2413 kilopascals (kPa) (about 340 to about 350 pounds per square inch-gauge (psig)) and at a described first reactor bed temperature RBT (e.g., 105° C.). Maintain the fluidized bed at a constant height by withdrawing a portion of the bed at a rate equal to the rate of production of particulate form of the unimodal ethylene-co-1-hexene copolymer, which production rate may be from 10 to 20 kilograms per hour (kg/hr), alternatively 13 to 18 kg/hr. Remove the product unimodal ethylene-co-1-hexene copolymer semi-continuously via a series of valves into a fixed volume chamber, wherein this removed unimodal ethylene-co-1-hexene copolymer is purged to remove entrained hydrocarbons and treated with a stream of humidified nitrogen (N_2) gas to deactivate any trace quantities of residual catalyst.

[0039] Polymerization or operating conditions are any variable or combination of variables that may affect a polymerization reaction in the GPP reactor or a composition or property of an unimodal ethylene-*co*-1-hexene copolymer product made thereby. The variables may include reactor design and size, catalyst composition and amount; reactant composition and amount; molar ratio of two different reactants; presence or absence of feed gases such as H₂ and/or O₂, molar ratio of feed gases versus reactants, absence or concentration of interfering materials (e.g., H₂O), absence or presence of an induced condensing agent (ICA), average polymer residence time in the reactor, partial pressures of constituents, feed rates of monomers, reactor bed temperature (e.g., fluidized bed temperature), nature or sequence of process steps, time periods for transitioning between steps. Variables other than that/those being described or changed by the method or use may be kept constant.

[0040] Comonomer/ethylene gas molar ratio C_X/C_2 is an operating condition that equals moles of comonomer (1-hexene, C₆) being fed into the gas-phase polymerization (GPP) reactor divided by moles of ethylene being fed into the GPP reactor during the polymerization method. The moles of comonomer and moles of ethylene used to calculate the C_X/C_2 gas molar ratio values are measured by gas flow meters or other suitable means.

[0041] Ethylene partial pressure (e.g., C₂P) in the GPP reactor. Generally from 690 to 2070 kilopascals (kPa, i.e., from 100 to 300 psia (pounds per square inch absolute)). 1.000 psia = 6.8948 kPa.

[0042] Hydrogen to ethylene (H₂/C₂) gas molar ratio is an operating condition in the GPP reactor that equals moles of molecular hydrogen gas being fed into the GPP reactor divided by moles of ethylene gas being fed into the GPP reactor during the polymerization method.

[0043] Induced condensing agent (ICA). An inert liquid useful for cooling materials in the polymerization reactor(s) (e.g., a fluidized bed reactor). In some aspects the ICA is a (C₅-C₂₀)alkane, alternatively a (C₁₁-C₂₀)alkane, alternatively a (C₅-C₁₀)alkane. In some aspects the ICA is a (C₅-C₁₀)alkane. In some aspects the (C₅-C₁₀)alkane is a pentane, e.g., normal-pentane or isopentane; a hexane; a heptane; an octane; a nonane; a decane; or a combination of any two or more thereof. In some aspects the ICA is isopentane (i.e., 2-methylbutane). The inventive method of polymerization, which uses the ICA, may be referred to herein as being an induced condensing mode operation (ICMO). Concentration in gas phase measured using gas chromatography by calibrating peak area percent to mole percent (mol%) with a gas mixture standard of known concentrations of ad rem gas phase components. Concentration may be from 1 to 10 mol%, alternatively from 3 to 8 mole%.

[0044] Oxygen (O₂) concentration relative to ethylene (“[O₂/C₂]”, volume parts O₂ per million volume parts ethylene (ppmv)) in the GPP reactor. Generally [O₂/C₂] is 0.0000 to 150 ppbv.

[0045] The polymerization method uses a gas-phase polymerization (GPP) reactor, such as a stirred-bed gas phase polymerization reactor (SB-GPP reactor) or a fluidized-bed gas-phase polymerization reactor (FB-GPP reactor), to make the unimodal ethylene-co-1-hexene copolymer. Such reactors and methods are generally well-known in the art. For example, the GPP reactor/method may employ the induced condensing agent and be conducted in condensing mode polymerization such as described in US 4,453,399; US 4,588,790; US 4,994,534; US 5,352,749; US 5,462,999; and US 6,489,408. The GPP reactor/method may be a fluidized-bed gas-phase polymerization reactor (FB-GPP reactor)/method as described in US 3,709,853; US 4,003,712; US 4,011,382; US 4,302,566; US 4,543,399; US 4,882,400; US 5,352,749; US 5,541,270; EP-A-0 802 202; and Belgian Patent No. 839,380. These SB-GPP and FB-GPP polymerization reactors and processes either mechanically agitate or fluidize by continuous flow of gaseous monomer and diluent the polymerization medium inside the reactor, respectively. Other reactors/processes contemplated include series or multistage polymerization processes such as described in US 5,627,242; US 5,665,818; US 5,677,375; EP-A-0 794 200; EP-B1-0 649 992; EP-A-0 802 202; and EP-B-634421.

[0046] The polymerization conditions may further include one or more additives such as a chain transfer agent, a promoter, or a scavenging agent. The chain transfer agents are well known and may be alkyl metal such as diethyl zinc. Promoters are known such as in US 4,988,783 and may include chloroform, CFCI₃, trichloroethane, and difluorotetrachloroethane. Scavenging agents may be a trialkylaluminum. Gas phase polymerizations may be operated free of (not deliberately added) scavenging agents. The polymerization conditions for gas phase polymerization reactor/method may further include an amount (e.g., 0.5 to 200 ppm based on all feeds into reactor) of a static control agent and/or a continuity additive such as aluminum stearate or polyethyleneimine. The static control agent may be added to the FB-GPP reactor to inhibit formation or buildup of static charge therein.

[0047] Start-up or restart of the GPP reactor may be illustrated with a fluidized bed, GPP reactor. The start-up of a recommissioned FB-GPP reactor (cold start) or restart of a transitioning FB-GPP reactor (warm start) includes a time period that is prior to reaching steady-state polymerization conditions of step (a). Start-up or restart may include the use of a polymer seedbed preloaded or loaded, respectively, into the fluidized bed reactor. The

polymer seedbed may be composed of powder of a polyethylene such as a polyethylene homopolymer or previously made batch of the unimodal ethylene-co-1-hexene copolymer.

[0048] Start-up or restart of the FB-GPP reactor may also include gas atmosphere transitions comprising purging air or other unwanted gas(es) from the reactor with a dry (anhydrous) inert purge gas, followed by purging the dry inert purge gas from the FB-GPP reactor with dry ethylene gas. The dry inert purge gas may consist essentially of molecular nitrogen (N₂), argon, helium, or a mixture of any two or more thereof. When not in operation, prior to start-up (cold start), the FB-GPP reactor contains an atmosphere of air. The dry inert purge gas may be used to sweep the air from a recommissioned FB-GPP reactor during early stages of start-up to give a FB-GPP reactor having an atmosphere consisting of the dry inert purge gas. Prior to restart (e.g., after a change in seedbeds), a transitioning FB-GPP reactor may contain an atmosphere of unwanted ICA or other unwanted gas or vapor. The dry inert purge gas may be used to sweep the unwanted vapor or gas from the transitioning FB-GPP reactor during early stages of restart to give the FB-GPP reactor an atmosphere consisting of the dry inert purge gas. Any dry inert purge gas may itself be swept from the FB-GPP reactor with the dry ethylene gas. The dry ethylene gas may further contain molecular hydrogen gas such that the dry ethylene gas is fed into the fluidized bed reactor as a mixture thereof. Alternatively the dry molecular hydrogen gas may be introduced separately and after the atmosphere of the fluidized bed reactor has been transitioned to ethylene. The gas atmosphere transitions may be done prior to, during, or after heating the FB-GPP reactor to the reaction temperature of the polymerization conditions.

[0049] Start-up or restart of the FB-GPP reactor also includes introducing feeds of reactants and reagents thereinto. The reactants include the ethylene and the alpha-olefin. The reagents fed into the fluidized bed reactor include the molecular hydrogen gas and the induced condensing agent (ICA) and the chromium-based catalyst system (e.g., ACCLAIM™ K-110 or K-120 advanced chrome catalyst).

[0050] In an embodiment the method uses a pilot scale fluidized bed gas phase polymerization reactor (Pilot Reactor) that comprises a reactor vessel containing a fluidized bed of a powder of the unimodal ethylene-co-1-hexene copolymer, and a distributor plate disposed above a bottom head, and defining a bottom gas inlet, and having an expanded section, or cyclone system, at the top of the reactor vessel to decrease amount of resin fines that may escape from the fluidized bed. The expanded section defines a gas outlet. The Pilot Reactor further comprises a compressor blower of sufficient power to continuously cycle or loop gas around from out of the gas outlet in the expanded section in the top of the reactor vessel down to and into the bottom gas inlet of the Pilot Reactor and through the distributor

plate and fluidized bed. The Pilot Reactor further comprises a cooling system to remove heat of polymerization and maintain the fluidized bed at a target temperature. Compositions of gases such as ethylene, alpha-olefin, hydrogen, and oxygen being fed into the Pilot Reactor are monitored by an in-line gas chromatograph in the cycle loop in order to maintain specific concentrations that define and enable control of polymer properties. In some embodiments the gases are cooled, resulting in their temperature dropping below their dew point, at which time the Pilot Reactor is in condensing mode operation (CMO) or induced condensing mode operation (ICMO). In CMO, liquids are present downstream of the cooler and in the bottom head below the distributor plate. The chromium-based catalyst system (e.g., ACCLAIM™ K-110 or K-120 advanced chrome catalyst) may be fed as a slurry or dry powder into the Pilot Reactor from high pressure devices, wherein the slurry is fed via a syringe pump and the dry powder is fed via a metered disk. The chromium-based catalyst system typically enters the fluidized bed in the lower 1/3 of its bed height. The Pilot Reactor further comprises a way of weighing the fluidized bed and isolation ports (Product Discharge System) for discharging the powder of unimodal ethylene-co-1-hexene copolymer from the reactor vessel in response to an increase of the fluidized bed weight as polymerization reaction proceeds.

[0051] In some embodiments the FB-GPP reactor is a commercial scale reactor such as a UNIPOL™ reactor or UNIPOL™ II reactor, which are available from Univation Technologies, LLC, a subsidiary of The Dow Chemical Company, Midland, Michigan, USA.

[0052] The chromium-based catalyst system (e.g., ACCLAIM™ K-110 or K-120 advanced chrome catalyst) is unimodal and comprises a reduced chromium oxide catalyst compound and, optionally, one or more of a modifying agent, a reducing agent, an activator, and a support material. The reduced chromium oxide catalyst compound may comprise or be a reaction product be prepared from an activated chromium oxide catalyst compound and a reducing agent, optionally modified by a silyl chromate catalyst compound. The chromium-based catalyst system may be unsupported, that is free of a support material. The support material differs from the activator and the chromium-based catalyst compound in at least one of function (e.g., reactivity), composition (e.g., metal content), and property such as porosity. Alternatively, the chromium-based catalyst system may further comprise a support material for hosting the chromium-based catalyst compound and/or an activator. The chromium-based catalyst compound of the chromium-based catalyst system may be activated by any suitable method, which may or may not employ an activator, and under any suitable activating conditions, as described herein.

[0053] The chromium oxide catalyst compound comprises CrO₃ or any chromium compound convertible to CrO₃ under catalyst activating conditions. Compounds convertible to CrO₃ are

disclosed in, for example, US 2,825,721; US 3,023,203; US 3,622,251; and US 4,011,382. Examples are chromic acetyl acetate, chromic halide, chromic nitrate, chromic acetate, chromic sulfate, ammonium chromate, ammonium dichromate, and other soluble, chromium containing salts. Chromium oxide catalyst compounds include Philips-type catalyst compounds, commonly referred to as “inorganic oxide-supported Cr^{+6} ” catalysts. A Philips-type catalyst compound may be formed by a process that includes impregnating a Cr^{+3} compound into a silica support, followed by calcining the impregnated silica support under oxidizing conditions at 300° to 900° C., alternatively, 400° to 860° C. to give the Philips-type catalyst compound. Under these conditions, at least some of the Cr^{+3} are converted to Cr^{+6} .

[0054] The silyl chromate catalyst compound may be a bis(trihydrocarbylsilyl) chromate or a poly(diorganosilyl) chromate. The bis(trihydrocarbylsilyl) chromate may be bis(triethylsilyl) chromate, bis(tributylsilyl) chromate, bis(triisopentylsilyl) chromate, bis(tri-2-ethylhexylsilyl) chromate, bis(tridecylsilyl) chromate, bis(tri(tetradecyl)silyl) chromate, bis(tribenzylsilyl) chromate, bis(triphenylethylsilyl) chromate, bis(triphenylsilyl) chromate, bis(tritolylsilyl) chromate, bis(trixylsilyl) chromate, bis(trinaphthylsilyl) chromate, bis(triethylphenylsilyl) chromate, or bis(trimethylnaphthylsilyl) chromate. The poly(diorganosilyl) chromate may be polydiphenylsilyl chromate or polydiethylsilyl chromate. In some embodiments, the silyl chromate compound is bis(triphenylsilyl) chromate, bis(tritolylsilyl) chromate, bis(trixylsilyl) chromate, or bis(trinaphthylsilyl) chromate; alternatively bis(triphenylsilyl) chromate. See US 3,324,101; US 3,704,287; and US 4,100,105.

[0055] Supported catalyst compounds. The chromium-based catalyst compound, such as the chromium oxide catalyst compound, the silyl chromate catalyst compound, and/or the reduced chromium oxide catalyst compound, independently may be unsupported, i.e., free of a support material. Alternatively, the chromium-based catalyst compound, such as the chromium oxide catalyst compound, the silyl chromate catalyst compound, or the reduced chromium oxide catalyst compound, may be disposed on a support material. That is, the chromium-based catalyst system may comprise the chromium-based catalyst compound and support material. Typically, the supported reduced chromium oxide catalyst compound is made *in situ* by contacting a pre-activated and supported chromium oxide catalyst compound, optionally modified with a silyl chromate catalyst compound, with a reducing agent to give an activated and supported reduced chromium oxide catalyst compound.

[0056] Support material. The support material may be an inorganic oxide material. The terms “support” and “support material” are the same as used herein and refer to a porous inorganic substance or organic substance. In some embodiments, desirable support materials may be inorganic oxides that include Group 2, 3, 4, 5, 13 or 14 oxides, alternatively Group 13 or 14

atoms. Examples of inorganic oxide-type support materials are silica, alumina, titania, zirconia, thoria, and mixtures of any two or more of such inorganic oxides. Examples of such mixtures are silica-chromium, silica-alumina, and silica-titania.

[0057] The inorganic oxide support material is porous and has variable surface area, pore volume, and average particle size. In some embodiments, the surface area is from 50 to 1000 square meter per gram (m^2/g) and the average particle size is from 20 to 300 micrometers (μm). Alternatively, the pore volume is from 0.5 to 6.0 cubic centimeters per gram (cm^3/g) and the surface area is from 200 to 600 m^2/g . Alternatively, the pore volume is from 1.1 to 1.8 cm^3/g and the surface area is from 245 to 375 m^2/g . Alternatively, the pore volume is from 2.4 to 3.7 cm^3/g and the surface area is from 410 to 620 m^2/g . Alternatively, the pore volume is from 0.9 to 1.4 cm^3/g and the surface area is from 390 to 590 m^2/g . Each of the above properties are measured using conventional techniques known in the art.

[0058] The support material may comprise silica, alternatively amorphous silica (not quartz), alternatively a high surface area amorphous silica (e.g., from 500 to 1000 m^2/g). Such silicas are commercially available from a number of sources including the Davison Chemical Division of W.R. Grace and Company (e.g., Davison 952 and Davison 955 products), and PQ Corporation (e.g., ES70 product). The silica may be in the form of spherical particles, which are obtained by a spray-drying process. Alternatively, MS3050 product is a silica from PQ Corporation that is not spray-dried. As procured, all of these silicas are not calcined (i.e., not dehydrated). Silica that is calcined prior to purchase may also be used as the support material.

[0059] Supported chromium compounds, such as, for example, supported chromium acetate, are commercially available and may be used as an embodiment of the chromium-based catalyst system. Commercial examples include Davison 957, Davison 957HS, and Davison 957BG products from Davison Chemical Division, and ES370 product from PQ Corp. The supported chromium compound may be in the form of spherical particles, which are obtained by a spray-drying process. Alternatively, C35100MS and C35300MS products from PQ Corporation are not spray-dried. As procured, all of these silicas are not activated. Supported chromium compounds that are activated prior to purchase may be used as the supported chromium compound.

[0060] Prior to being contacted with a chromium oxide catalyst compound, the support material may be pre-treated by heating the support material in air to give a calcined support material. The pre-treating comprises heating the support material at a peak temperature from 350° to 850° C., alternatively from 400° to 800° C., alternatively from 400° to 700° C., alternatively from 500° to 650° C. and for a time period from 2 to 24 hours, alternatively from

4 to 16 hours, alternatively from 8 to 12 hours, alternatively from 1 to 4 hours, thereby making a calcined support material. In some aspects the support material is a calcined support material.

[0061] In some embodiments the supported chromium oxide catalyst system further comprises a silyl chromate compound as a modifying agent. As such, the silyl chromate compound may be added to a slurry of the activated (unsupported or supported) chromium oxide catalyst system in a non-polar aprotic solvent to give a slurry of a modified activated supported chromium oxide catalyst system. The solvent may be removed by heating, optionally under reduced pressure, according to the drying process described herein.

[0062] Catalyst activation. Any one of the foregoing chromium oxide catalyst compounds or silyl chromate catalyst compound, whether unsupported or supported on an uncalcined or calcined support material, independently may be activated by heating in an oxidative environment (e.g., well-dried air or oxygen) at an activation temperature of from 300° C. or higher with the proviso that the maximum activation temperature is below that at which substantial sintering of the compounds and/or support material would occur. The activating gives an activated (unsupported or supported) chromium oxide catalyst compound and/or an activated (unsupported or supported) silyl chromate catalyst compound. For example to activate the Philips catalyst, a fluidized bed of the supported chromium oxide catalyst compound may be activated by passing a stream of dry air or oxygen therethrough, thereby displacing any water therefrom and converting at least some Cr⁺³ compound to Cr⁺⁶ compound. The maximum activation temperature may be from 300° to 900° C., alternatively 400° to 850° C., alternatively from 500° to 700° C., alternatively from 550° to 650° C. The activation time period may be from 1 to 48 hours, alternatively from 1 to 36 hours, alternatively from 3 to 24 hours, alternatively from 4 to 6 hours. All other things being equal, the higher the activation temperature used, the shorter the activation period of time to achieve a given level of activation, and vice versa. The resulting activated (unsupported or supported) chromium oxide catalyst system may be in the form of a powdery, free-flowing particulate solid.

[0063] The reduced chromium oxide catalyst compound. An activated (unsupported or supported) reduced chromium oxide catalyst compound and system may be prepared from the activated (unsupported or supported) chromium oxide catalyst system. In one embodiment, the activated (unsupported or supported) chromium oxide catalyst system has been prepared from a calcined support material. The activated (unsupported or supported) chromium oxide catalyst system may be unmodified, alternatively may have been modified by the silyl chromate compound according to the modifying method described earlier. The

preparing comprises agitating a slurry of the activated (unsupported or supported) chromium oxide catalyst system in a non-polar, aprotic solvent under an inert atmosphere, adding a reducing agent to the agitated slurry over a period of time (addition time), and then allowing the resulting reaction mixture to react under the inert atmosphere for a period of time (reaction time) to make the activated (unsupported or supported) reduced chromium oxide catalyst compound and system, which typically is supported on the support material, as a slurry in the non-polar, aprotic solvent. The inert atmosphere may comprise anhydrous N₂ gas, Ar gas, He gas, or a mixture thereof. The inert atmosphere may be at a pressure from 101 to 700 kilopascals (kPa). The temperature of the agitated slurry during the adding step may be from 30° to 80° C., alternatively from 40° to 60° C. The agitation may be performed at a rate less than 70 rotations per minute (rpm) and the addition time may be less than 20 minutes. Alternatively, the agitation rate may be greater than 70 rpm and the addition time may be less than 20 minutes. Alternatively, the agitation rate may be greater than 70 rpm and the addition time may be greater than 20 minutes. The agitation rate may be from 30 to 50 rpm, and the addition time may be from 20 to 80 minutes. The temperature of the reaction mixture during the allowing step may be from 20° to 80° C., alternatively from 20° to 60° C., alternatively from 20° to 40° C. The reaction time period may be from 0.08 to 2 hours.

[0064] The reducing agent may be an organoaluminum compound, such as an aluminum alkyl or an alkyl aluminum alkoxide. The alkyl aluminum alkoxide may be of formula R₂AlOR, wherein each R is independently an unsubstituted (C₁-C₁₂)alkyl group, alternatively unsubstituted (C₁-C₁₀)alkyl group, alternatively unsubstituted (C₂-C₈)alkyl group, alternatively unsubstituted (C₂-C₄)alkyl group. Examples of the alkyl aluminum alkoxides are diethyl aluminum methoxide, diethyl aluminum ethoxide, diethyl aluminum propoxide, dimethyl aluminum ethoxide, di-isopropyl aluminum ethoxide, di-isobutyl aluminum ethoxide, methyl ethyl aluminum ethoxide and mixtures thereof. In one aspect the reducing agent is diethyl aluminum ethoxide (DEAIE).

[0065] The non-polar, aprotic solvent may be an alkane, or a mixture of alkanes, wherein each alkane independently has from 5 to 20 carbon atoms, alternatively from 5 to 12 carbon atoms, alternatively from 5 to 10 carbon atoms. Each alkane independently may be acyclic or cyclic. Each acyclic alkane independently may be straight chain or branched chain. The acyclic alkane may be pentane, 1-methylbutane (isopentane), hexane, 1-methylpentane (isohexane), heptane, 1-methylhexane (isoheptane), octane, nonane, decane, or a mixture of any two or more thereof. The cyclic alkane may be cyclopentane, cyclohexane, cycloheptane, cyclooctane, cyclononane, cyclodecane, methycyclopentane, methylcyclohexane, dimethylcyclopentane, or a mixture of any two or more thereof. The non-

polar, aprotic solvent may be a mixture of at least one acyclic alkane and at least one cyclic alkane.

[0066] Thereafter, the slurry of the activated (unsupported or supported) reduced chromium oxide catalyst compound and system may be dried to remove the non-polar, aprotic solvent. The drying comprises heating the slurry, optionally under reduced pressure, and in an environment that excludes oxidizing contaminants such as air or oxygen. The drying process transitions the activated (unsupported or supported) reduced chromium oxide catalyst compound and system from a viscous slurry to a partially dried slurry or mud to a free-flowing powder. Helical ribbon agitators may be used in vertical cylindrical blenders to accommodate the varying mixture viscosities and agitation requirements. Drying may be conducted at pressures above, below, or at normal atmospheric pressure as long as contaminants such as oxygen are strictly excluded from the activated (unsupported or supported) reduced chromium oxide catalyst compound and system. Drying temperatures may range from 0° to 100° C., alternatively from 40° to 85° C., alternatively from 55° to 75° C. Drying times may be from 1 to 48 hours, alternatively from 3 to 26 hours, alternatively from 5 to 20 hours. All other things being equal, the higher the drying temperature and/or lower the drying pressure, the shorter the drying time, and vice versa. After drying, the activated (unsupported or supported) reduced chromium oxide catalyst compound and system may be stored under an inert atmosphere until use.

[0067] Activator. Also referred to as a co-catalyst, an activator is a compound that enhances the catalytic performance of a catalyst. Aluminum alkyls may be used as activators for reduced chromium oxide catalyst compounds. The aluminum alkyl may also be used to improve the performance of the activated (unsupported or supported) reduced chromium oxide catalyst compound and system. The use of an aluminum alkyl allows for variable control of side branching in the polymer product, and desirable catalyst productivities. The aluminum alkyl may be applied to the reduced chromium oxide catalyst compound directly before the latter is fed into the GPP reactor. Alternatively, the reduced chromium oxide catalyst compound and aluminum alkyl may be fed separately into the GPP reactor, wherein they contact each other *in situ*, which may shorten or eliminate any catalyst induction time. See US 7,504,467 B2.

[0068] During the inventive method or use, the chromium-based catalyst system, once activated, may be fed into the GPP reactor as a dry powder, alternatively as a slurry in a non-polar, aprotic solvent, which is as described above.

[0069] Chromium oxide catalyst compounds and reduced chromium oxide catalyst compounds and methods of preparation thereof, as well as characteristics of the polymer

products formed therefrom, are described in US 6,989,344; US 2011/0010938 A1; US 2016/0297907 A1; or WO 2017/132092 A1.

[0070] In some embodiments the chromium-based catalyst system comprises the reduced chromium oxide catalyst system. In some embodiments the reduced chromium oxide catalyst system comprises ACCLAIM™ K-100 catalyst system, ACCLAIM™ K-110 catalyst system, or ACCLAIM™ K-120 catalyst system. The ACCLAIM™ catalyst systems are all available from Univation Technologies, LLC, Houston, Texas, USA.

[0071] The ACCLAIM™ K-100, K-110, and K-120 catalyst systems may be prepared on commercial scales as follows. The preparations varying slightly depending on a small differences in concentrations of aluminum (DEALE) used thereon in Part (B), described herein. Part (A): activation of supported chromium oxide catalyst system as a powder. Charge a fluidized bed heating vessel with a quantity of a porous silica support containing about 5 wt% chromium acetate (Grade C35300MSF chromium on silica, produced by PQ Corporation), which amounts to about 1 wt% Cr content, having a particle size of about 82 micrometers (μm) and a surface area of about 500 m^2/g . Heat up the vessel contents at a rate of about 50° C. per hour under a dry nitrogen stream up to 200° C., and hold at that temperature for about 4 hours. Next, further heat up the vessel contents at a rate of about 50° C per hour under dry nitrogen to 450° C., and hold at that temperature for about 2 hours. Replace the dry nitrogen stream with a stream of dry air, and heat the vessel contents at a rate of about 50° C. per hour to 600° C., and maintain at 600° C. for about 6 hours to give activated chromium oxide catalyst. Cool the activated catalyst dry air stream (at ambient temperature) to about 300° C., replace the dry air stream with a dry nitrogen stream and further cool from 300° C. to room temperature under the dry nitrogen stream (at ambient temperature). The resulting cooled, activated supported chromium oxide catalyst system is a powder. Store the powder under dry nitrogen atmosphere in a mixing vessel until used in Part (B).

[0072] Part (B) reduction of activated chromium oxide catalyst system to give ACCLAIM™ K-100, K-110, or K-120 catalyst system. For pilot scale, fit a vertical catalyst blender with a double helical ribbon agitator, and charge with about 0.86 kg of the powder form of the activated supported chromium oxide catalyst of Part (A) under an inert atmosphere. Add dried hexane or isopentane solvent (7.1 L solvent per kg of powder) to adequately suspend the powder and form a slurry. Agitate the slurry, warm to approximately 45° C., and add a 25 wt% solution of DEAIE (Akzo Nobel) in isopentane or hexane above the surface of the catalyst slurry at a rate so that the addition occurs over about a 40 minutes time period to obtain a selected wt% aluminum loading on the powder, wherein the wt% aluminum loading

is different depending upon whether ACCLAIM™ K-100, K-110, or K-120 catalyst system is being prepared. Further agitate the resulting at a controlled rate for about 1 hour on a pilot scale or 2 hours on a commercial scale. Then substantially remove the solvent from the resulting reaction mixture by drying at a selected jacket temperature for about 16 to 21 hours. Select the jacket temperature to give a material temperature that lines out near a target of 61°, 64°, 71°, or 81° C. during the later hours of drying, typically 16 hours for pilot scale. As drying time goes on, apply a progressively stronger vacuum to the vessel. The reduced chromium oxide catalyst system comprising ACCLAIM™ K-100, K-110, or K-120 catalyst system is obtained as a dry, free-flowing powder, which is stored in a container under dry nitrogen pressure until used in a polymerization reaction.

[0073] Ethylene. A compound of formula $\text{H}_2\text{C}=\text{CH}_2$. The polymerizable monomer.

[0074] 1-hexene. A compound of formula $\text{H}_2\text{C}=\text{C}(\text{H})\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$. The polymerizable comonomer.

[0075] Unimodal ethylene-co-1-hexene copolymer. A macromolecule, or collection of macromolecules, composed of repeat units wherein 50.0 to < 100 mole percent (mol%), alternatively 70.0 to 99.99 mol%, alternatively 95.0 to 99.9 mol% of such repeat units are derived from ethylene monomer, and from > 0 to 50.0 mol%, alternatively from 0.01 to 30.0 mol%, alternatively 0.1 to 5.0 mol% of the remaining repeat units are comonomeric units derived from 1-hexene; or collection of such macromolecules. The collection of macromolecules is characterized by a single peak (no shoulder) in a plot of $dW/d\text{Log}(\text{MW})$ on the y-axis versus $\text{Log}(\text{MW})$ on the x-axis to give a Gel Permeation Chromatograph (GPC) chromatogram, wherein $\text{Log}(\text{MW})$ and $dW/d\text{Log}(\text{MW})$ are as defined below and measured by Gel Permeation Chromatograph (GPC) Test Method described herein.

[0076] The film. The film may be unembossed or embossed. The film may be tailored for specific uses by adjusting thickness of the film, combination with other films or additives, or not. The film may be a monolayer film. In some aspects the film has a thickness from 0.0051 to 0.254 mm (0.2400 mil to 10 mils), alternatively from 0.0102 to 0.254 mm (0.400 mil to 10 mils), alternatively from 0.01143 mm to 0.254 mm (0.450 mil to 10 mils), alternatively from 0.01143 mm to 0.127 mm (0.450 mil to 5.00 mils), alternatively from 0.01143 mm to 0.0762 mm (0.450 mil to 3.00 mils), alternatively from 0.0127 mm to 0.0635 mm (0.500 mil to 2.50 mils).

[0077] Embodiments of the blown film may optionally contain zero, one or more film additives. The “film additive” is a compound or material other than a polyolefin polymer that imparts one or more properties to, and/or enhances one or more properties of, the blown film. Examples of film additives are antimicrobial agents, antioxidants, catalyst neutralizers

(of chromium-based catalysts), colorants, and light stabilizers. The film additive(s), when present, may be pre-mixed with the unimodal ethylene-co-1-hexene copolymer prior to the melting step in the method of making the blown film. Alternatively, film additive(s), when present, may be added to the melt of the unimodal ethylene-co-1-hexene copolymer during or after the melting step and prior to the extruding step in the method of making the blown film. When two or more film additives are used, one or more film additives may be pre-mixed with the unimodal ethylene-co-1-hexene copolymer prior to the melting step in the method of making the blown film and a one or more film additives may be added to the melt of the unimodal ethylene-co-1-hexene copolymer during or after the melting step and prior to the extruding step in the method of making the blown film. In some aspects the blown film consists essentially of the unimodal ethylene-co-1-hexene copolymer, at least one antioxidant, and at least one catalyst neutralizer (of chromium-based catalysts). Examples of the at least one antioxidant and at least one catalyst neutralizer are described herein.

[0078] The film may be made using any extrusion or co-extrusion methods including blown, tenterd, and cast film methods. The blown film may be made on a blown-film-line machine configured for making polyethylene films. The machine may be configured with a feed hopper in fluid communication with an extruder in heating communication with a heating device capable of heating a polyethylene in the extruder to a temperature of up to 500° C. (e.g., 430° C.), and wherein the extruder is in fluid communication with a die having an inner diameter of 10.2 to 20.3 centimeters (4 to 8 inches) and a fixed die gap (e.g., 1.0 to 1.5 millimeter gap (39 to 59 mils)), a blow up ratio of 3:1 to 5:1, and a stalk Neck Height (NH)–to-die diameter of 8:1 to 9:1. Step (a) may be done in the feed hopper.

[0079] The film may be unoriented, uniaxially oriented, or biaxially oriented. The film may be oriented in the direction of extrusion (machine direction or MD), alternatively in the direction transverse to the direction of extrusion (transverse direction or TD). The film may be oriented by stretching or pulling a film in the MD to give a MD oriented film, simultaneously or followed by stretching or pulling the MD oriented film in the TD to give a film that is biaxially oriented in MD and TD.

[0080] The film may have one or more improved properties such as enhanced (increased) bubble stability, enhanced (increased) MD and/or TD Elmendorf Tear performance, enhanced (increased) MD tensile strength and/or TD tensile strength, enhanced (increased) dart impact performance, or a combination of any two or more thereof.

[0081] The film may be combined with one or more other films to make multilayer films or laminates.

[0082] The film is useful for making containers and wraps. Examples of such containers are bags such as ice bags and grocery bags. Examples of such wraps are stretch films, meat

wraps, and food wraps. The inventive copolymer is also useful in a variety of non-film related applications including in vehicle parts.

[0083] The following apply unless indicated otherwise. Alternatively precedes a distinct embodiment. ASTM means the standards organization, ASTM International, West Conshohocken, Pennsylvania, USA. Any comparative example is used for illustration purposes only and shall not be prior art. Free of or lacks means a complete absence of; alternatively not detectable. IUPAC is International Union of Pure and Applied Chemistry (IUPAC Secretariat, Research Triangle Park, North Carolina, USA). May confers a permitted choice, not an imperative. Operative means functionally capable or effective. Optional(ly) means is absent (or excluded), alternatively is present (or included). Properties are measured using a standard test method and conditions for the measuring (e.g., viscosity: 23° C and 101.3 kPa). Ranges include endpoints, subranges, and whole and/or fractional values subsumed therein, except a range of integers does not include fractional values. Room temperature: 23° C. $\pm$ 1° C.

EXAMPLES

[0084] Density is measured according to ASTM D792-13, *Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement*, Method B (for testing solid plastics in liquids other than water, e.g., in liquid 2-propanol). Report results in units of grams per cubic centimeter (g/cm^3). In some aspects the density is from 0.89 to 0.98 g/cm^3 , alternatively from 0.92 to 0.97 g/cm^3 , alternatively 0.940 to 0.960 g/cm^3 .

[0085] Dynamic Mechanical Analysis (DMA) Test Method: a dynamic mechanical analysis method measured at 190° C. and 0.126 radians per second (rad/s) or 126 rad/s using the following procedure: Perform small-strain (10%) oscillatory shear measurements on polymer melts at 190° C. using an ARES-G2 Advanced Rheometric Expansion System, from TA Instruments, with parallel-plate geometry to obtain the values of storage modulus (G'), loss modulus (G'') complex modulus (G^*) and complex viscosity (η^*) as a function of frequency (ω). Obtain a SH1000 value by calculating the complex viscosities (η^*) at given values of frequency (ω), and calculating the ratio of the two viscosities. For example, using the values of frequency (ω) of 0.126 rad/s and 126 rad/s, obtain the SH1000 = $\text{Eta}^*0.126/\text{Eta}^*126$ (i.e., $\eta^*(0.126 \text{ rad/s})/\eta^*(126 \text{ rad/s})$ at a constant value of loss modulus G'' of 3,000 pascals (Pa). The SH1000 is defined as the ratio of the two complex viscosities $\text{Eta}^*0.126/\text{Eta}^*126$ (i.e., $\eta^*(0.126 \text{ rad/s})/\eta^*(126 \text{ rad/s})$).

[0086] Gel permeation chromatography (GPC) Test Method: Weight-Average Molecular Weight Test Method: determine M_w , number-average molecular weight (M_n), and M_w/M_n using chromatograms obtained on a High Temperature Gel Permeation Chromatography

instrument (HTGPC, Polymer Laboratories). The HTGPC is equipped with transfer lines, a differential refractive index detector (DRI), and three Polymer Laboratories PLgel 10 μ m Mixed-B columns, all contained in an oven maintained at 160° C. Method uses a solvent composed of BHT-treated TCB at nominal flow rate of 1.0 milliliter per minute (mL/min.) and a nominal injection volume of 300 microliters (μ L). Prepare the solvent by dissolving 6 grams of butylated hydroxytoluene (BHT, antioxidant) in 4 liters (L) of reagent grade 1,2,4-trichlorobenzene (TCB), and filtering the resulting solution through a 0.1 micrometer (μ m) Teflon filter to give the solvent. Degas the solvent with an inline degasser before it enters the HTGPC instrument. Calibrate the columns with a series of monodispersed polystyrene (PS) standards. Separately, prepare known concentrations of test polymer dissolved in solvent by heating known amounts thereof in known volumes of solvent at 160° C. with continuous shaking for 2 hours to give solutions. (Measure all quantities gravimetrically.) Target solution concentrations, c , of test polymer of from 0.5 to 2.0 milligrams polymer per milliliter solution (mg/mL), with lower concentrations, c , being used for higher molecular weight polymers. Prior to running each sample, purge the DRI detector. Then increase flow rate in the apparatus to 1.0 mL/min/, and allow the DRI detector to stabilize for 8 hours before injecting the first sample. Calculate M_w and M_n using universal calibration relationships with the column calibrations. Calculate MW at each elution volume with following equation:

$$\log M_X = \frac{\log(K_X / K_{PS})}{a_X + 1} + \frac{a_{PS} + 1}{a_X + 1} \log M_{PS}$$

, where subscript "X" stands for the test sample, subscript "PS" stands for PS standards, $a_{PS} = 0.67$, $K_{PS} = 0.000175$, and a_X and K_X are obtained from published literature. For polyethylenes, $a_X/K_X = 0.695/0.000579$. For polypropylenes $a_X/K_X = 0.705/0.0002288$. At each point in the resulting chromatogram, calculate concentration, c , from a baseline-subtracted DRI signal, I_{DRI} , using the following equation: $c = K_{DRI} I_{DRI} / (dn/dc)$, wherein K_{DRI} is a constant determined by calibrating the DRI, / indicates division, and dn/dc is the refractive index increment for the polymer. For polyethylene, $dn/dc = 0.109$. Calculate mass recovery of polymer from the ratio of the integrated area of the chromatogram of concentration chromatography over elution volume and the injection mass which is equal to the pre-determined concentration multiplied by injection loop volume. Report all molecular weights in grams per mole (g/mol) unless otherwise noted. Further details regarding methods of determining M_w , M_n , MWD are described in US 2006/0173123 page 24-25, paragraphs [0334] to [0341]. Plot of

dW/dLog(MW) on the y-axis versus Log(MW) on the x-axis to give a GPC chromatogram, wherein Log(MW) and dW/dLog(MW) are as defined above.

[0087] High Load Melt Index (HLMI) I_{21} Test Method: use ASTM D1238-13, *Standard Test Method for Melt Flow Rates of Thermoplastics by Extrusion Platometer*, using conditions of 190° C./21.6 kilograms (kg). Report results in units of grams eluted per 10 minutes (g/10 min.).

[0088] Melt Index I_5 (“ I_5 ”) Test Method: use ASTM D1238-13, using conditions of 190° C./5.0 kg. Report results in units of grams eluted per 10 minutes (g/10 min.).

[0089] Melt Flow Ratio MFR5: (“ I_{21}/I_5 ”) Test Method: calculated by dividing the value from the HLMI I_{21} Test Method by the value from the Melt Index I_5 Test Method.

[0090] Melt Storage Modulus Test Method: On polymer melts at 190° C. perform small-strain (10%) oscillatory shear at varying frequency from 0.02 radian per second (rad/s) to about 200 rad/s using an ARES-G2 Advanced Rheometric Expansion System, from TA Instruments, with parallel-plate geometry to obtain the G' ($G''=3,000$ Pa) value in pascals of melt storage modulus (G') at a dynamic frequency where loss modulus (G'') is equal to 3,000 Pa.

[0091] Antioxidant 1: pentaerythritol tetrakis(3-(3,5-di-tert-butyl-4-hydroxyphenyl)propionate. Obtained as IRGANOX 1010 from BASF.

[0092] Antioxidant 2: tris(2,4-di-tert-butylphenyl)phosphite. IRGAFOS 168 from BASF.

[0093] Catalyst Neutralizer 1: zinc stearate.

[0094] Chromium-based Catalyst system: the ACCLAIM™ K-110 catalyst system or ACCLAIM™ K-120 catalyst system. Obtained from Univation Technologies LLC, Houston, Texas, USA.

[0095] Comonomer: 1-hexene. See later for C_6/C_2 gas molar ratio.

[0096] Ethylene (“ C_2 ”): See later for partial pressure of C_2 .

[0097] Molecular hydrogen gas (“ H_2 ”): See later for H_2/C_2 gas molar ratio.

[0098] Molecular oxygen gas (“ O_2 ”): See later for O_2/C_2 gas volume ratio.

[0099] Unimodal ethylene-co-1-hexene copolymers: target density is 0.938 to 0.941 g/cm³ and target flow index (I_{21}) is 17 to 23 g/10 minutes.

[00100] Inventive Examples 1 to 4 (IE1 to IE4): polymerization procedure: Runs began with ACCLAIM™ K-110 Catalyst or ACCLAIM™ K-120 Catalyst, and comonomer 1-hexene according to the Pilot Reactor and method described earlier to give in different parts, as described below, different embodiments of the unimodal ethylene-co-1-hexene copolymer

as granular resins. The operating conditions for the polymerization are reported below in Table 1.

[00101] Table 1: Inventive Operating conditions for IE1 to IE4.

[00102] As shown in Table 1, the operating conditions used to make the unimodal ethylene-co-1-hexene copolymers of IE1 to IE4 comprise a bed temperature from 105.0° to 109.0° C.; an ethylene (C₂) partial pressure 1379 kpa; an H₂/C₂ Molar Ratio from 0.10 to 0.140; a C₆/C₂ Molar Ratio from 0.0110 to 0.0162; an O₂/C₂ Volume Ratio from 37 to 117 ppbv (parts per billion by volume/volume); and a superficial gas velocity of 0.60 m/sec (meter per second). In certain embodiments, the method of synthesizing the unimodal ethylene-co-1-hexene copolymer employ the aforementioned operating conditions.

[00103] Formulation and Pelletization Procedure: Each of the different granular resins of IE1 to IE4 was separately mixed with 1,300 parts per million weight/weight (ppm) of Antioxidant 1, 1,300 ppm Antioxidant 2, and 1,000 ppm Catalyst Neutralizer 1 in a ribbon blender, and then compounded into underwater cut pellets using a twin-screw extruder LCM100. The resulting pellets of each resin were tested for flow index (I₂₁), density, and melt storage modulus G' (G''=3,000 Pa) according to their aforementioned respective test methods. Results are reported later. In certain embodiments, the unimodal ethylene-co-1-hexene copolymer further comprises at least one antioxidant selected from Antioxidants 1 and 2; at least one catalyst neutralizer selected from Catalyst Neutralizer 1 and calcium stearate; or a combination thereof. Results are reported below in Table 2.

[00104] Table 2: Inventive Melt properties of IE1 to IE4.

Test	IE1	IE2	IE3	IE4
I ₂₁ (190° C., 21.6 kg) (g/ 10 min.)	22.3	21.1	22.4	17.7

Eta*126 (Pa-s)	1281	1341	1322	1450
Shear thinning SH1000	41.1	35.4	33.7	38.1

[00105] As shown in Table 2, the melt properties of the unimodal ethylene-co-1-hexene copolymers of IE1 to IE4 comprise a high-load melt index I₂₁ (190° C., 21.6 kg) from 17.7 to 22.3 g/ 10 min.; a melt flow ratio MFR5 (I₂₁/ I₅) from 20.2 to 22.8; a melt elasticity G' (G''=3,000 Pa) from 1944 to 2064 Pa; a complex viscosity at 126 rad./sec from 1281 to 1450 Pa-s; a shear thinning SH1000 from 33.7 to 41.1; and satisfaction of Equation 1. In certain

embodiments, the unimodal ethylene-co-1-hexene copolymer is characterized by any one, alternatively all but one, alternatively each of the aforementioned melt properties.

[00106] The melt properties data in Table 2 for the unimodal ethylene-co-1-hexene copolymer were analyzed to discover on what reactor/process operating conditions the melt properties depend. The following operating conditions are found to influence the melt properties of the unimodal ethylene-co-1-hexene copolymer made thereby: increasing H_2/C_2 gas molar ratio and reactor bed temperature in the process yielded inventive unimodal ethylene-co-1-hexene copolymer beneficially having reduced shear thinning and decreased melt elasticity G' ($G''=3,000$ Pa) (Pa) to meet the combination defined by Eq. 1, and thus having improved (increased) bubble stability in blown film process.

[00107] Granular resins of IE1 to IE4 were characterized by density, molecular weights, M_w/M_n ($\bar{M}$), I_5 , I_{21} . Results are reported below in Table 3.

[00108] Table 3: Inventive Resin properties of IE1 to IE4.

Test	IE1	IE2	IE3	IE4
Density (g/cm ³)	0.939	0.939	0.939	0.939
M_n (g/mol)	7,681	9,352	9,235	8,816
M_w (g/mol)	297,076	277,019	267,530	298,283
M_w/M_n ($\bar{M}$)	38.7	29.6	29.0	33.8

[00109] As shown in Table 3, the resin properties of the inventive unimodal ethylene-co-1-hexene copolymers of IE1 to IE4 comprise a density of 0.939 g/cm³; a number-average molecular weight from 7,681 to 9,352 g/mol; a weight-average molecular weight from 267,530 to 298,283 g/mol; and a molecular mass dispersity M_w/M_n ($\bar{M}$) from 29.0 to 38.7. In certain embodiments, the unimodal ethylene-co-1-hexene copolymer is characterized by any one, alternatively all but one, alternatively each of the aforementioned resin properties.

[00110] Film Forming Procedure: Pellets of granular resins of the inventive unimodal ethylene-co-1-hexene copolymer of IE1 to IE4 are separately melted at melt temperature described herein, and separately blown into films using an Alpine 50 millimeter (mm) 25:1 length to diameter (L/D) dimensioned barrier single screw extruder, a 120 mm inner diameter die, a 1.2 mm die gap, a blow up ratio 4:1 and stalk neck height 8:1 without IBC (internal bubble cooling). The bubble stabilities of the films were measured according to the following method: (a) bubble rating at standard output rate of 6.9 kilograms per hour-centimeter (kg/hour-cm, bubble rating STD); (b) a bubble rating at standard output rate with maximum line speed greater than 14.2 meters per minute (m/min., bubble rating MLS); and (c) bubble

rating at maximum output rate (20% or more output rate, bubble rating MOR). Bubble ratings were scored on a scale from 1 to 5 as follows: 1. Film could not be made. 2. Film could be made but production of film had bubble instability. 3. Film could be made but production of film had slight bubble instability. 4. Film could be made with bubble stability. 5. Film could be made with very stable bubble. If the STD bubble rating is 4 or 5, the resin passes the bubble stability test and is characterized as “Good”. If the STD bubble rating is 3, the resin passes the bubble stability test and is characterized as “Okay”. If the STD bubble rating is 2, the resin fails the bubble stability test and is characterized as “Moderate”. If the STD bubble rating is 1, the resin fails the bubble stability test and is characterized as “Poor”. Film results are reported below in Table 4.

[00111] Table 4: Inventive Film properties of Inventive IE1 to IE4.

Test	IE1	IE2	IE3	IE4
Extruder speed (rpm)	97	97	97	97
Motor load (%)	60.7	61.5	61.9	62.5
Melt temp. (° C.)	199	200	199	203

Bubble Rating STD	4	4	4	4
STD Bubble Quality	Good	Good	Good	Good
Bubble Rating MLS	4	3	3	4
Bubble Rating MOR	4	4	4	2

[00112] N/r means not recorded. As shown in Table 4, the inventive film properties of the blown films of the inventive unimodal ethylene-co-1-hexene copolymers of IE1 to IE4 comprise a bubble rating STD of 4, a bubble rating MLS of 3 or 4, a bubble rating MOR from 2 or 4, and an STD bubble quality of Good. In certain embodiments, the unimodal ethylene-co-1-hexene copolymer, and the blown films thereof, are independently characterized by any one (e.g., STD), alternatively all but one, alternatively each of the aforementioned bubble ratings.

[00113] Comparative Examples 1 to 4 (CE1 to CE4) of comparative unimodal ethylene-co-1-hexene copolymer were prepared using ACCLAIM™ K-110 or K-120 catalyst system and target density is 0.938 to 0.940 g/cm³ and target flow index (I₂₁) is 20 to 23 g/10 minutes under different process conditions than those used to prepare the inventive unimodal ethylene-co-1-hexene copolymer of IE1 to IE4. The product resins had a density of 0.939 g/cm³, melt elasticity G' (G''=3,000 Pa) and complex viscosity ratio (shear thinning) properties of 2205 Pa and 45.1 (CE1), 2136 Pa and 43.4 (CE2), 2055 Pa and 36.1 (CE3), or

2095 Pa and 43.0 (CE4). The comparative resins were prepared as blown films and evaluated for bubble stability as described earlier for IE1. Results are shown below in Table 5.

[00114] Table 5: Comparative Film properties of comparative CE1 to CE4.

Test	CE1	CE2	CE3	CE4
Extruder speed (rpm)	97	97	97	97
Motor load (%)	N/r	N/r	N/r	N/r
melt temp. (° C.)	N/r	N/r	N/r	N/r
Die Press (MPa)	N/r	N/r	N/r	N/r
Bubble Rating STD	2	1	1	1
STD Bubble Quality	Moderate	Poor	Poor	Poor
Bubble Rating MLS	N/T	N/T	N/T	N/T
Bubble Rating MOR	1	1	4	4

[00115] N/r means not recorded. As shown in Table 5, the comparative film properties of the blown films of comparative unimodal ethylene-co-1-hexene copolymers of CE1 to CE4 comprise a bubble rating STD of 2 or 1, a bubble rating MOR of 1 or 4, and an STD bubble quality of Moderate or Poor.

[00116] FIG. 1 is a plot of the melt property spaces of the inventive examples IE1 to IE4 and the comparative examples CE1 to CE4. The melt property spaces are defined by the combination of melt elasticity G' ($G''=3,000$ Pa) in Pascals (Pa) measured according to Melt Storage Modulus Test Method (described herein) at loss modulus $G'' = 3000$ pascals, versus SH1000 complex viscosity ratio (shear thinning) equal to $\text{Eta}^{*0.126}/\text{Eta}^{*126}$, wherein $\text{Eta}^{*0.126}$ is complex viscosity in pascal-seconds (Pa-s) measured at 0.126 radian per second (rad/s) by Dynamic Mechanical Analysis Test Method. In FIG. 1, the endpoints for Eq. 1 are shown as dotted lines labelled with $y = 6x + \text{####}$, wherein x is SH1000, y is G' ($G''=3,000$ Pa) and #### is either 1,721 or 1,828. The comparative examples CE1 to CE4 (circles with white centers) are located in a non-inventive melt property space bounded above the line defined by $y = 6x + 1828$. Inventive examples IE1 to IE4 (bottom four black dots) are located in an inventive melt property space bounded by the line defined by $y = 6x + 1721$ (lower dotted line in FIG. 1) and the line defined by $y = 6x + 1828$ (upper dotted line in FIG. 1).

CLAIMS

1. A unimodal ethylene-co-1-hexene copolymer that, when in melted form at 190° C., is characterized by a melt property space defined by a combination of melt elasticity and complex viscosity ratio properties, wherein the combination is defined according to equation 1 (Eq. 1): $6 \cdot \text{SH1000} + 1,721 < G' (G''=3,000 \text{ Pa}) < 6 \cdot \text{SH1000} + 1,828$ (Eq. 1); wherein $<$ is less than; $\cdot$ is multiplication; $+$ is addition; G' ($G''=3,000 \text{ Pa}$) is melt elasticity in Pascals (Pa) measured according to Melt Storage Modulus Test Method (described herein) at loss modulus $G'' = 3000$ pascals; SH1000 is a complex viscosity ratio equal to $\text{Eta}^*0.126/\text{Eta}^*126$, wherein $\text{Eta}^*0.126$ is complex viscosity in pascal-seconds (Pa-s) measured at 0.126 radian per second (rad/s) by Dynamic Mechanical Analysis Test Method (described herein); and Eta^*126 is complex viscosity in Pa-s measured at 126 rad/s by the Dynamic Mechanical Analysis Test Method.

2. The unimodal ethylene-co-1-hexene copolymer of claim 1 characterized by at least one of properties (a) to (g):

(a) a density from 0.935 to 0.945 gram per cubic centimeter (g/cm^3) measured according to ASTM D792-13, Method B;

(b) a high load melt index (I_{21}) from 17.5 to 22.6 grams per 10 minutes (g/10 min.), measured according to ASTM D1238-13 (190° C., 21.6 kg);

(c) a melt flow ratio (MFR5 or I_{21}/I_5) from 20.1 to 22.9, wherein I_{21} is measured according to ASTM D1238-13 (190° C., 21.6 kg) and I_5 is melt index in g/10 min. measured according to ASTM D1238-13 (190° C., 5.0 kg);

(d) a molecular mass dispersity (M_w/M_n), Đ_M , from 28.9 to 38.7, wherein M_w and M_n are measured according to the GPC Test Method;

(e) wherein the combination of melt elasticity and complex viscosity ratio (shear thinning) properties is defined according to equation 1a (Eq. 1a): $\text{Eq. 1a: } 6 \cdot \text{SH1000} + 1,726 < G' (G''=3,000 \text{ Pa}) < 6 \cdot \text{SH1000} + 1,824$ (Eq. 1a);

(f) a complex viscosity Eta^*126 from 1225 to 1345 pascal-seconds (Pa-s) measured at 126 radians per second by Dynamic Mechanical Analysis Test Method; and

(g) a complex viscosity ratio SH1000 from 33.6 to 44.0, wherein SH1000 is the ratio of complex viscosity measured at 0.126 radian per second ($\text{Eta}^*0.126$) to the Eta^*126 .

3. The unimodal ethylene-co-1-hexene copolymer of claim 2 further defined by any one of limitations (i) to (xi): (i) properties (a) and (b); (ii) properties (a) and (c); (iii) properties (a) and (d); (iv) properties (a) and (e); (v) properties (a) and (f); (vi) properties (a) and (g); (vii) properties (a), (b), and (c); (viii) properties (a), (b), and (d); (ix) properties (f) and (g); (x) any six of properties (a) to (g); and (xi) each of properties (a) to (g).

4. The unimodal ethylene-co-1-hexene copolymer of any one of claims 1 to 3 further characterized by any one of properties (h) to (i), or a combination of properties (h) and (i): (h) a weight-average molecular weight (M_w) from 200,000.0 to 300,000.0 grams per mole (g/mol) measured according to the Gel Permeation Chromatography (GPC) Test Method; and (i) a number-average molecular weight (M_n) from 7,600.0 to 10,000.0 g/mol measured according to the GPC Test Method.
5. A method of synthesizing the unimodal ethylene-co-1-hexene copolymer of any one of claims 1 to 4, the method consisting essentially of contacting ethylene and 1-hexene ("C₆") with a single catalyst system consisting of a unimodal chromium catalyst system in a single fluidized bed, gas-phase polymerization (FB-GPP) reactor under effective operating conditions comprising a reactor bed temperature (RBT), an average polymer residence time (avgPRT), and an ethylene partial pressure (C₂P) and receiving an ethylene (C₂) feed, a comonomer (1-hexene or "C₆") feed, a hydrogen (H₂) feed, and, optionally, an oxygen (O₂) feed wherein the feeds are characterized by a H₂/C₂ gas molar ratio (H₂/C₂), a comonomer/ethylene gas molar ratio ("C₆/C₂"), and a O₂/C₂ gas volume ratio ("[O₂/C₂]", vol/vol in ppmv); wherein RBT is from 101° to 111° C.; avgPRT is from 1.70 to 3.10 hours, C₂P is from 1,100 to 1,900 kilopascals (kPa); H₂/C₂ gas molar ratio is from 0.05 to 0.150; C₆/C₂ gas molar ratio is from 0.010 to 0.021; and O₂/C₂ gas volume ratio is from > 0 to 130 parts per billion volume/volume (ppbv); thereby synthesizing the unimodal ethylene-co-1-hexene copolymer in the FB-GPP reactor.
6. The method of claim 5 further comprising removing the unimodal ethylene-co-1-hexene copolymer from the FB-GPP reactor to give a removed unimodal ethylene-co-1-hexene copolymer.
7. A manufactured article comprising the unimodal ethylene-co-1-hexene copolymer of any one of claims 1 to 4.
8. A film consisting essentially of the unimodal ethylene-co-1-hexene copolymer of any one of claims 1 to 4.
9. A method of making a blown film, the method comprising melting the unimodal ethylene-co-1-hexene copolymer of any one of claims 1 to 4 so as to give a melt thereof, extruding the melt through a die configured for forming a bubble so as to make a bubble of the unimodal ethylene-co-1-hexene copolymer, and blowing the bubble with a film-blowing machine, thereby making the blown film.
10. A blown film made by the method of claim 9 and consisting essentially of the unimodal ethylene-co-1-hexene copolymer of any one of claims 1 to 4.
