

TRANSACTION PROCESSING METHOD AND SYSTEM, AND STORAGE MEDIUM

ABSTRACT

Embodiments of this specification provide a transaction processing method and system, and
5 a storage medium. In the method, a computing device receives a processing request corresponding
to a target transaction, where the target transaction is associated with a target user and a target
merchant; obtains a portrait feature of the target user and a portrait feature of the target merchant
based on the processing request; further obtains M limitation rules used to limit a transaction,
where each limitation rule includes at least a user reference feature and a merchant reference
10 feature that are satisfied by a to-be-limited transaction, and M is an integer greater than or equal
to 1; and finally, determines, based on the portrait feature of the target user, the portrait feature of
the target merchant, and the M limitation rules, whether to intercept the target transaction.
