REQUEST SENDING METHOD AND DEVICE THEREOF

Abstract

The present application discloses a request sending method, which includes receiving a request instruction sent by a user, wherein the request instruction includes request numerical information and a requested object identifier; splitting, according to a requested object limiting rule, a specific numerical value indicated by the request numerical information into at least two request numerical values conforming to the limiting rule; and successively sending, for the at least two request numerical values conforming to the limiting rule, requests to a requested object indicated by the requested object identifier. The deficiency of poor experience that is caused by the need of initiating a numerical data sending request for multiple times by a user is avoided. The present application further discloses a request sending apparatus.
