

WASHING MACHINE

ABSTRACT

5 There are provided detergent tank (117) mounted in tank storage case (114) and an automatic liquid agent injection device configured to supply a liquid agent inside detergent tank (117) to a water tub. Detergent tank (117) has cylindrical portion (123) configured to discharge the liquid agent. The automatic liquid agent injection device includes a detergent-side cylindrical
10 portion connected to cylindrical portion (123). Tank storage case (114) has inclined surface (114j) formed on a side wall so as to be inclined downward toward cylindrical portion (123) and the detergent-side cylindrical portion and hole (114k) formed above inclined surface (114j) and configured to inject water toward inclined surface (114j). This makes it possible to wash away a liquid
15 agent and the like adhering to coupling portions between detergent tank (117) and the automatic liquid agent injection device every time water is supplied.
