

ABSTRACT

The present application relates to the technical field of laundry treatment, and provides a laundry treatment device. The laundry treatment device comprises an electrolysis apparatus, a laundry treatment chamber, a water valve and a first liquid path. The electrolysis apparatus comprises an electrode assembly, the electrode assembly comprising electrode sheets and a solid electrolyte, at least one electrode sheet being a cathode, at least one electrode sheet being an anode, the cathode and the anode being stacked along a first direction, and the solid electrolyte being disposed between the cathode and the anode. The first liquid path is connected to the water valve and the laundry treatment chamber, and the electrolysis apparatus is disposed in the first liquid path.
