ABSTRACT

The present disclosure discloses a data processing method and system. The method includes: acquiring first identification information of a first server, where the first identification information is used for identifying the first server; acquiring status information of the first server based on the first identification information, where the status information is used for indicating whether the first identification information has been collected by a target interface of an access device; in response to the status information indicating that the first identification information has not been collected by the target interface, transmitting the first identification information to the target interface to establish a first mapping relationship between the first server and the target interface based on the first identification information. The present application solves a technical problem.
