Electronic video product supporting interactive interconnected system

[Technical Field]

The invention relates to an information association technology of a cross-media product, in particular to an electronic video product supporting an interactive interconnected system for achieving barrier-free development of information.

[Background Art]

With the rapid development of a broadband wireless access technology and a mobile terminal technology, people have an urgent hope to be able to obtain information and service from Internet conveniently at will in a mobile process whenever and wherever possible.

However, mobile Internet is not mobilized Internet, but is a generic term of activities of combination and practice of technologies, platforms, commercial modes and applications of the Internet, and mobile communication technologies.

Mobile terminals will be more networked and socialized in future. How will the boring fragmented time of the people be made full use of? Such boring fragmented time is isolated and short. Since a mobile phone and other intelligent terminals are closest to the people, they can be considered as a constituent part of the people.

As the mobile phone becomes a mobile carrier in an information network, the mobile phone is not just a tool for making a call and sending short messages any longer, but is a miniature computer which can achieve ultimate combination of communication and the Internet to enable people to enter the era of mobile informatization really.

The mobile informatization is to realize comprehensive application of an information system on a handheld terminal such as the mobile phone in a manner of fusion of communication technologies such as telecommunications, broadcast and the Internet to achieve the purpose of obtaining relevant information whenever and wherever possible at will at last.

Although the transmission capacity of a traditional media advertisement product is lower than that of electronic media obviously, electronic media are not an "ultimate media form which can replace any one of the traditional print paper media, traditional broadcast, traditional television, traditional Internet and the like" praised highly by some people.

How do matters stand?

The development of the electronic media still has serious defects and deficiencies. Due to the lack of relevant technical support for achieving cross-media information interaction association, so-called omnimedia is just to prepare the information content of the plane media into an electronic edition to be provided for a user to select.

With the development of a new generation broadcast technology based

on DAB (Digital Audio Broadcasting), DVB (Digital Video Broadcasting), DMB (Digital Media Broadcasting) and the like, scientific and technical workers all over the world try hard to solve the relevant problems, for example Chinese invention patents 200310113194.8, 200610072903.6, 200580034624.4, 200620039633.4 and the like, which only effectively improve the transmission capacity of the information.

The smart phone shall log in the relevant electronic Internet of the cross-media product information to obtain richer relevant information epitaxially, the association technology is a non-spanning necessity, and the association technology and a transmission technology are two technical purposes of different concepts.

The existing association technology on the market is mainly a QR code pattern technical scheme. Although the QR code pattern technical scheme has become a mature product and industrial chain, there are many technical use condition limits in actual operation, as follows:

1. The smart phone can carry out capturing after downloading an appropriate application.
2. Definition of a QR code pattern.
3. Light during capturing of the QR code pattern.
4. Distance for capturing of the QR code pattern.
5. The QR code patterns are different in size (including 8mm*8mm, 10mm*10mm....100mm*100mm, etc.), and the attached QR code patterns influence the appearance attractiveness of an advertisement board.

If the QR code patterns are implanted into a screen frame and a webpage of a video product... during the actual operation, an electronic screen displays the QR code patterns for a very short time, and the user operation is difficult.

In addition, the QR code pattern technical scheme is powerless to achieve broadcast (an audio information technology) association with a multimedia information signal...

Therefore, a simpler and quicker interaction association technology with a high effect for randomly meeting the requirements anytime and anywhere is an urgent hope for the market.

The interactive interconnected system provided by the invention is a technology for achieving barrier-free transmission of the cross-media product information.

[Summary]

In order to achieve the above purposes, the invention provides an electronic video product supporting an interactive interconnected system. The electronic video product supports transmit-receive of a video information signal of the interactive interconnected system, and is characterized in that

the interactive interconnected system comprises an electronic reading device and an electronic transmitter-receiver;

the video information signal is formed by associated data and media

information data;

the associated data is a preset URI (Uniform Resource Identifier);

the electronic reading device is provided with a combination data reception circuit, a combination data decomposition circuit and a transmission circuit; the combination data reception circuit is configured to receive the video information signal; the combination data decomposition circuit is configured to decompose the video information signal into the media information data and the associated data; the decomposed associated data is transmitted to the electronic transmitter-receiver via the transmission circuit;

the electronic transmitter-receiver is provided with an associated data reception circuit, an associated data transmission circuit and a central processing unit (with memory);

the associated data reception circuit is equipped with a short-distance signal transmission-reception circuit; and

the electronic transmitter-receiver is mainly configured to control transmit-receive of the associated data of the decomposed video information signal, receive the associated data decomposed by the transmission circuit of the electronic reading device, transmit the associated data to an external information data storage center via a remote wireless technology, and quickly call out an associated electronic file.

The electronic reading device is provided with the combination data reception circuit, the combination data decomposition circuit, the transmission circuit, and a CPU (Central Processing Unit) module, which are embedded into the electronic video product supporting the interactive interconnected system; and

the electronic transmitter-receiver is provided with an associated data reception circuit, an associated data transmission circuit and a central processing unit (with memory), which are embedded into a communication terminal product of the interactive interconnected system.

The combination data reception circuit, the combination data decomposition circuit, the transmission circuit and a CPU module of the electronic reading device, as well as the associated data reception circuit, the associated data transmission circuit and a central processing unit module (comprising the memory) of the electronic transmitter-receiver are embedded into the electronic video product supporting the interactive interconnected system.

The electronic reading device is provided with the combination data reception circuit, the combination data decomposition circuit, the transmission circuit, and a CPU module board, which are placed in a small mobile box and connected with the electronic video product supporting the interactive interconnected system.

the transmission circuit of the electronic reading device is equipped with the short-distance signal transmission-reception circuit;

the combination data decomposition circuit of the electronic reading

device is configured to decompose the video information signal into the media information data that includes video data, audio data and the like;

The video data after decomposition of the media information data is transmitted to related configuration for use after transmitted to a video system for processing;

The audio data after the decomposition of the media information data is transmitted to the related configuration for use after transmitted to an audio system for processing; and

the decomposed associated data is transmitted by the transmission circuit and the equipped short-distance signal transmission-reception circuit.

The electronic transmitter-receiver is provided with an association operation key supporting the interactive interconnected system.

The electronic transmitter-receiver is provided with a mobile association operation key supporting the interactive interconnected system.

The electronic transmitter-receiver is provided with a signal induction system and the association operation key supporting the interactive interconnected system.

The video information signal is transmitted by a signal transmission station and a signal transmission transfer device.

The associated data received from the electronic transmitter-receiver come from various transmission approaches, and the electronic transmitter-receiver is connected with an electronic storage device of the video information signal supporting the interactive interconnected system for data receive.

The invention provides an electronic video product supporting an interactive interconnected system, which realizes the interaction association of cross-media information products and achieves the goal of barrier-free information:

1. The electronic video product may acquire the relevant associated data from the multimedia information signal supporting the interactive interconnected system, and the related associated data is transmitted synchronously as a quick entry point of an electronic webpage to meet random technical requirements of the mobile informatization anytime and anywhere.

2. Due to the technical combination characteristic of the interactive interconnected system, original functions of the product are not changed, and combined functions can support mutually to achieve an obvious technical effect,

and the barrier-free information connection of a cross-media product can be achieved by the simplest point-to-point association technology, and the interaction association capacity of the interactive interconnected system is obviously better than that of the existing QR code and other association technology solutions on the market.

The invention has the particular contribution that the associated data can be transmitted by taking various approaches, so that the invention

solves the technical problem of information congestion in the mobile informatization development effectively, and assists in improving the existing traffic light facility by using the existing social resources of advertisement boards in bus shelters, and visually impaired people obtain help of voice guide and relevant traffic information service via the communication terminal products (such as a smart phone) supporting the interactive interconnected system.

[Detailed Description of Preferred Embodiments]

The following embodiments further explain and describe the invention, and do not constitute any limit to the invention;

The invention provides an electronic video product supporting an interactive interconnected system. The electronic video product 61 supports transmit-receive of a video information signal 01 of the interactive interconnected system, wherein

the interactive interconnected system comprises an electronic reading device 02 and an electronic transmitter-receiver 03;

the video information signal is synthesized by associated data 12 and

media information data;

the associated data is a preset URI (Uniform Resource Identifier);

as shown in Figure 1A,

the electronic reading device is provided with a combination data reception circuit 21, a combination data decomposition circuit 22 and a transmission circuit 24; the combination data reception circuit is configured to receive the video information signal; the combination data decomposition circuit 22 is configured to decompose the video information signal into the media information data and the associated data; the decomposed associated data is transmitted to the electronic transmitter-receiver via the transmission circuit 24;

the electronic transmitter-receiver is provided with an associated data reception circuit 31, an associated data transmission circuit 32 and a central processing unit (with memory);

the associated data reception circuit 31 is equipped with a short-distance signal transmission-reception circuit;

the short-distance communication technology includes NFC and Bluetooth technology, etc.; and

the electronic transmitter-receiver is mainly configured to control transmit-receive of the associated data of the decomposed video information signal, receive the associated data decomposed by the transmission circuit of the electronic reading device, transmit the associated data to an external information data storage center via a remote wireless technology, and quickly call out an associated electronic file.

The remote communication technology includes GSM (Global System for Mobile), CDMA (Code Division Multiple Access), GPRS (General Packet Radio Service) and other technologies.

The external information data storage center may be a memory of a related product, Internet, cloud storage and the like, or a built-in memory of the electronic reading device.

The called electronic file is viewed by a visual electronic screen product, including an electronic terminal product, a communication terminal product, a computer, an electronic video product and the like supporting an interaction association technology.

As shown in Figure 1B,

There is one information content as shown in the figure, one associated data (i.e. URI (Uniform Resource Identifier) is required to be set for the information content. The associated data transmits repeatedly within a readable period.

As shown in Figure 1C,

The associated data is an associated data group 12X as a combination of more than one associated data, and the different URIs (Uniform Resource Identifiers) are set for the different associated data respectively.

As shown in Figure 1D,

six information contents are shown, and correspond to the six

associated data (namely the six URIs (Uniform ResourceResource Identifiers)), and the different URIs (Uniform ResourceResource Identifiers) are associated with different electronic files...

The URI (Uniform Resource Identifier) T01 corresponds to the information content 01...

The URI (Uniform Resource Identifier) T05 corresponds to the information content 05...

The URI (Uniform Resource Identifier) TX corresponds to the information content X...

The multiple replication and cyclic transmission are set for the different associated data within the reading time of the six different media information contents.

The associated data sets an electronic reading code 14, the different electronic reading codes correspond to the different associated data, and the different URIs (Uniform Resource Identifiers) are set for the different associated data respectively.

The application of the existing technical scheme on the market is as follows.

As shown in Figure 3A,

the electronic video product 61 plays a video content, and the traditional communication terminal product (the smart phone) can only obtain relevant video content data of the electronic video product with a traditional downloading method.

For example, the relevant electronic product plays a video program which introduces various contents; in order to allow a user to log in a website (or a service center) of the relevant contents for more detailed information search, or further learn the relevant contents by making a call via the communication terminal product (the smart phone) conveniently, the multimedia program makes a sound for prompting the relevant website or a phone number, or gives a QR code pattern.... Since the information prompt is instant,

1. Most audiences are too late to mark down.

2. The visually impaired people are very difficult to carry out relevant operations.

In order to improve the impact of the traditional media, there're various technical solutions on the market. One technical solution
is a QR code technical solution. Relevant application examples are as follows.

As shown in Figure 3B,

the electronic video product 61 plays the video program which introduces various contents;
the QR code pattern is implanted into a window screen (a planar information technology) to allow the audiences to see concerned advertisement contents conveniently;

1. The QR code pattern is captured by the smart phone and processed

and converted into the URI (Uniform Resource Identifier)...

2. Access to the website of the relevant URI (Uniform Resource Identifier) is logged in...

3. The traditional webpage search operation is carried out...

As shown in Figure 3C,

a large media company adopts an interaction screen scheme of an RFID (Radio Frequency Identification) technology, and compared with the traditional advertisement display screen, three small interaction induction screens are added below the original single display screen, which are carriers of an interaction transmission platform.

The operation method is as follows: a Q card is an only key for enabling the platform; a user shall apply for an RFID card (Q card);
after the user activates the card by transmitting a short message after receiving the card, the Q card can be swiped in an induction area of the interaction screen; and promotion information displayed in the advertisement screen can be transmitted to the mobile phone in a short message form.

When the interaction screen scheme is compared with the traditional advertisement screen, the three small interaction induction screens are added below the original single display screen, and are used as carriers of the interaction transmission platform, and many barriers will be encountered during actual operation;

for example, the user shall carry the Q card and a Q card plan of the mobile phone, and shall pursue interaction within two minutes, which is an excessively difficult challenge.

As shown in Figure 4A,

the QR code patterns have been implanted into three LED (Light Emitting Diode) boards of a station respectively (the planar information technology) to allow waiters to see the concerned advertisement contents;

1. The QR code pattern is captured by the smart phone and processed and converted into the URI (Uniform Resource Identifier)...

2. Access to the website of the relevant URI (Uniform Resource Identifier) is logged in...

3. Different series operating times shall be repeated for the different QR code patterns...

It shall be especially emphasized that the operation will be very complicated if the QR code patterns attached to the three LED boards of the station are not associated with the information from the same electronic website.

The user shall capture the QR code patterns within a short time, which is a technical challenge.

The relevant embodiments of the invention are as follows.

First mode:

The electronic reading device is provided with the combination data reception circuit, the combination data decomposition circuit, the

transmission circuit, and a CPU (Central Processing Unit) module, which are embedded into the electronic video product supporting the interactive interconnected system; and

the electronic transmitter-receiver is provided with an associated data reception circuit, an associated data transmission circuit and a central processing unit (with memory), which are embedded into a communication terminal product of the interactive interconnected system.

Due to the technical combination characteristic of the interactive interconnected system, original functions of the product are not changed, and combined functions can support mutually to achieve an obvious technical effect, and the barrier-free information connection of the cross-media product can be achieved by the simplest point-to-point association technology.

There are two operating methods for obtaining the associated data basically:

first method: on the smart phone (within an effective range), an association operation key 39 is pressed at will (to start the interactive interconnected system),and then the association operation key 39 is pressed again, so that the electronic transmitter-receiver can obtain the selected associated data (namely the URI (Uniform Resource Identifier)) from the electronic reading device;

second method: on the smart phone (within an effective range),the association operation key 39 is pressed at will(to start the interactive interconnected system), and then a corresponding figure (the electronic reading code) according to a figure implanted into the information content (a planar identification mark) is input, so that the electronic transmitter-receiver can obtain the selected associated data (namely the URI (Uniform Resource Identifier)) from the electronic reading device...

Another use method is as follows: the user presses an enter key after accomplishing relevant steps of the first method or the second method, and the electronic transmitter-receiver can obtain the selected associated data from the electronic reading device for storage.

Afterwards, the set associated electronic file can be called out quickly anytime, and the associated data can be
transmitted to the data storage center via the transmission circuit to quickly call out the set associated electronic file for viewing (or listening) on the smart phone.

Second mode:

The combination data reception circuit, the combination data decomposition circuit, the transmission
circuit and the CPU module of the electronic reading device, as well as the associated data reception circuit, the associated data transmission circuit and the central processing unit (comprising the memory) module of the electronic transmitter-receiver are embedded into the electronic video product supporting the interactive interconnected system.

As shown in Figures 1A, 1C and 2B, the user receives the associated data from the electronic video product supporting the interactive interconnected system via the communication terminal product (the smart phone) under the guidance of the video information content of the electronic video product, and then transmits the associated data synchronously to achieve a point-to-point effect.

It shall be especially emphasized that the mode can provide more conveniences for the visually impaired people and the hearing impaired people to use public facilities.

Third mode:

The electronic reading device is provided with the combination data reception circuit, the combination data decomposition circuit, the transmission circuit, and the CPU module board, which are placed in a small mobile box and connected with the electronic video product supporting the interactive interconnected system, such as a set top box on the market.

the transmission circuit of the electronic reading device is equipped with the short-distance signal transmission-reception circuit;

the combination data decomposition circuit of the electronic reading device is configured to decompose the video information signal into the media information data that includes video data 10, audio data 11 and the like;

The video data after decomposition of the media information data is transmitted to related configuration for use after transmitted to a video system for processing;

The audio data after the decomposition of the media information data is transmitted to the related configuration for use after transmitted to an audio system for processing; and

the decomposed associated data is transmitted by the transmission circuit and the equipped short-distance signal transmission-reception circuit.

The electronic transmitter-receiver is provided with an association operation key 39 supporting the interactive interconnected system.

The electronic transmitter-receiver is provided with a mobile association operation key 39 supporting the interactive interconnected system, which can be operated remotely.

The electronic transmitter-receiver is provided with a signal induction system 36 and the association operation key 39 supporting the interactive interconnected system.

The multiple replication and cyclic transmission are set for the associated data within the reading time of the media information data, the user is only required to press the association operation key 39, and the electronic transmitter-receiver is configured to receive the associated data decomposed by the transmission circuit of the electronic reading device, transmit the associated data to the external information data storage center via the remote wireless technology, and quickly call out the associated electronic file associated with the information data storage center.

Since many information signals exist in the atmosphere, the communication terminal product supporting the interactive interconnected system is provided with the signal induction device 36 (including light, sound and the like) to remind the user that the relevant associated data of the interactive interconnected system can be provided for a position range where the user is located...which particularly meets the requirements of the visually impaired people.

the association address data is association hybrid data 12M capable of being mixed with content data such as characters, images, audio and video, the association hybrid data 12M is decomposed into the associated data by an association hybrid data decomposition circuit, and user can carry out selective operation according to the requirements via guide information such as the relevant characters, images, audio and video displayed on an electronic display screen of the electronic transmitter-receiver.

Embodiment 1

As shown in Figure 3D, the communication terminal product 38 is matched with the video information signal for use, and the associated data can be obtained very easily with the first or second method... Obviously, the visually impaired people can carry out operations and use.

Embodiment 2

Another important value of the invention is to support the development of the information accessibility and utilize the existing advertisement board resources of the bus shelters in society:

1. Braille characters and braille icons are attached to the print advertisement boards of the station for guidance.

2. Prompts supporting the interactive interconnected system are provided on the print advertisement boards of the station to allow the impaired people to obtain the relevant traffic information and service from smart phone supporting the interactive interconnected system.

As shown in Figure 4B, the three LED boards of the station adopts the technology of the invention, the figures are implanted into advertisement contents of the LED boards, and the LED boards provide the relevant associated data (simple voice prompt) supporting the interactive interconnected system. As a result, the visually impaired people are able to use.

Embodiment 3

The blind are the weakest group in the disabled; In order to allow the blind to participate in the social life equally, it is required to raise the education level of them; although we cannot give a pair of eyes for the blind to see the outside world, our love can allow the blind to feel the light of life at heart.

A special broadcasting program for the visually impaired people can be added in the video program; an audio content of the broadcasting program are to introduce various products meeting the requirements of the visually

impaired people; and when the visually impaired people need (or are interested) when listening to broadcasting, the visually impaired people start the association operation key via the smart phone supporting the interactive interconnected system (namely the first method of the invention)...

The visually impaired people can obtain (listen to) more relevant information contents of the products via the electronic files set by the associated data... or conduct a subscription procedure.

As shown in Figure 2B,

The video information signal is transmitted by a signal transmission station and a signal transmission transfer device.

As shown in Figure 2A,

The associated data received from the electronic transmitter-receiver is from various transmission approaches, and the electronic transmitter-receiver is connected with an electronic storage device of the video information signal supporting the interactive interconnected system for data receive.

The electronic storage device includes an electronic data memory, a compact disc, and the like.

When the invention is compared with the operation of obtaining the associated data via the QR code patterns;

1. The interactive interconnected system shall be embedded into the smart phone for support, which is the same as the QR code patterns.

2. Obtaining of the associated data is much more sensitive and accurate than capturing of the QR code patterns.

3. The associated data can be obtained without influence of light conditions.

4. The distance for obtaining the associated data may be set within a range of tens of meters as required, and the invention is very stable, while the QR code pattern technical scheme has an operationable range of about 1m under the normal condition.

5. The figures are used for replacing the QR code patterns, which can reduce the influence on the appearance attractiveness of the advertisement boards.

By reference to the effects of the above relevant embodiments, through the comparison between the invention and the relevant technical solutions and product schemes on the market,
the invention is obviously superior to the others in use, operation, manufacturing cost and transmission effect, and the development of the invention
will influence all links of a commercial chain, and create a brand-new commercial mode and value chain.

Although the invention is revealed through the above embodiments, the range of the invention is not limited to those, and the above members may be replaced by similar or identical elements realized by those skilled in the art under the condition of not deviating from the conception of the invention.

Claims

1. An electronic video product supporting the interactive interconnected system, wherein the electronic video product (61) supporting transmit-receive of a video information signal (01) of the interactive interconnected system is characterized in that

the interactive interconnected system comprises an electronic reading device (02) and an electronic transmitter-receiver (03);

the video information signal is formed by associated data (12) and media information data;

the associated data is a preset URI (Uniform Resource Identifier);

the electronic reading device is provided with a combination data reception circuit (21), a combination data decomposition circuit (22) and a transmission circuit (24); the combination data reception circuit is configured to receive the video information signal; the combination data decomposition circuit (22) is configured to decompose the video information signal into the media information data and the associated data; the decomposed associated data is transmitted to the electronic transmitter-receiver via the transmission circuit (24);

the electronic transmitter-receiver is provided with an associated data reception circuit (31), an associated data transmission circuit (32) and a central processing unit (with memory);

the associated data reception circuit (31) is equipped with a short-distance signal transmission-reception circuit; and

the electronic transmitter-receiver is mainly configured to control transmit-receive of the associated data of the decomposed video information signal, receive the associated data decomposed by the transmission circuit of the electronic reading device, transmit the associated data to an external information data storage center via a remote wireless technology, and quickly call out an associated electronic file.

2. The electronic video product supporting the interactive interconnected system of claim 1, wherein

the electronic reading device is provided with the combination data reception circuit, the combination data decomposition circuit, the transmission circuit, and a CPU (Central Processing Unit) module, which are embedded into the electronic video product supporting the interactive interconnected system; and

the electronic transmitter-receiver is provided with an associated data reception circuit, an associated data transmission circuit and a central processing unit (with memory), which are embedded into a communication terminal product supporting interactive interconnected system.

3. The electronic video product supporting the interactive

interconnected system of claim 1, wherein

the combination data reception circuit, the combination data decomposition circuit, the transmission circuit and a CPU module of the electronic reading device, as well as the associated data reception circuit, the associated data transmission circuit and a central processing unit module (comprising the memory) of the electronic transmitter-receiver are embedded into the electronic video product supporting the interactive interconnected system.

4. The electronic video product supporting the interactive interconnected system of claim 1, wherein

the electronic reading device is provided with the combination data reception circuit, the combination data decomposition circuit, the transmission circuit, and a CPU module board, which are placed in a small mobile box and connected with the electronic video product supporting the interactive interconnected system.

5. The electronic video product supporting the interactive interconnected system of claim 2 or 3 or 4, wherein

the transmission circuit of the electronic reading device is equipped with the short-distance signal transmission-reception circuit;

the combination data decomposition circuit of the electronic reading device is configured to decompose the video information signal into the media information data that includes video data (10), audio data (11) and the like; the media information is decomposed into video information data. The video information data is transmitted to a digital system for processing. And then the video information data is transmitted to related device for use.

The media information is decomposed into audio information data. The audio information data is transmitted to a digital system for processing. And then the audio information data is transmitted to related device for use.

the decomposed associated data is transmitted by the transmission circuit and the equipped short-distance signal transmission-reception circuit.

6. The electronic video product supporting the interactive interconnected system of claim 1, wherein

the electronic transmitter-receiver is provided with an association operation key (39) supporting the interactive interconnected system.

7. The electronic video product supporting the interactive interconnected system of claim 1, wherein

the electronic transmitter-receiver is provided with a mobile association operation key (39) supporting the interactive interconnected system.

8. The electronic video product supporting the interactive interconnected system of claim 1, wherein

the electronic transmitter-receiver is provided with a signal induction system (36) and the association operation key (39) supporting the interactive interconnected system.

9. The electronic video product supporting the interactive interconnected system of claim 1, wherein

the video information signal is transmitted by a signal transmission station and a signal transmission transfer device.

10.

The electronic video product supporting the interactive interconnected system of claim 1, wherein

the associated data is came from various transmission approach. The associated data is received by electronic transmitter-receiver. The electronic transmitter-receiver is connected with an electronic storage device supporting the interactive interconnected system. The video information signal data is stored in electronic storage device.
