

WELL ASSEMBLY COUPLING**ABSTRACT**

5 Assemblies that can be disposed in a subterranean bore and that can facilitate branch
wellbore creation are described. An assembly can include threadedly coupled
components having inner and outer sealing members in grooves. The sealing member
can cooperate with the components to provide a pressure seal. The assembly can also
include a venting member for equalizing pressure in a chamber defined by the coupled
10 components. One of the components can be made from aluminum. At least part of
that component can be coated with a coating material that is nonconductive.
