ABSTRACT

A Game Device

An embodiment of the invention discloses a game device, involving the field of electronic equipment, which extends game modes and game device functions that enable the game to have more diversity and entertainment. The specific solutions are: a game device comprising a memory for storing game procedure codes, game records, rules of the game and game odds under the rules of the game; a controller for providing game modes setting function keys and bet selecting function keys under corresponding game modes, and sending a corresponding control command to a processor according to player's control and selection; a processor for executing the game procedure codes stored in the memory, so as to take charge of the core processing of the game; a display for displaying the rules of the game, game odds under the rules, and game interface images generated by the processor.
