

SPEAKER SYSTEM

ABSTRACT

A loudspeaker device includes enclosure (11), loudspeaker unit (12) and
5 passive radiator (13) both mounted to enclosure (11). Passive radiator (13)
includes edge (13b) sandwiched and bonded between first diaphragm (13d) and
second diaphragm (13c). This structure allows increasing the bonding strength
between edge (13b) and first diaphragm (13d) as well as between edge (13b) and
second diaphragm (13c), so that the loudspeaker device can withstand greater
10 maximum inputs and reproduce quality bass sound.
