ABSTRACT

This application discloses a method and an apparatus for processing avatar usage data, a device, and a storage medium, and belongs to the field of computer technologies. In this application, obtained avatar usage data is queried, to determine at least two first avatars associated with the avatar usage data and permission data of the first avatars. That is, a user obtains the avatar usage data, so as to use a plurality of avatars. If the user selects a target avatar from the plurality of avatars, the target avatar is loaded in the target round, and the permission data of the target avatar associated with the avatar usage data is updated. Through application of the foregoing solution, the user does not need spend a lot time in collecting different avatars when the user wants to use the different avatars, thereby reducing complexity of user operations, simplifying operation steps, and improving the efficiency of human-computer interaction.
