SYSTEMS AND METHODS FOR PROVIDING GAMING ACTIVITIES

Described herein are various systems and methods for providing gaming activities, these particularly relating to gaming activities where a plurality of players provide
10 respective entry fees. Traditional gaming activities necessarily involve the player putting his or her entry fee at risk. The present invention, at least in some of its preferred forms, modifies the traditional approaches of operating such gaming activities so that the player's entry fee is not necessarily placed entirely at risk. Indeed, in some embodiments a player is provided with an option to participate on the
15 basis that his or her entry fee is wholly refundable while retaining the opportunity to win prizes, potentially alongside more risky though still modified participation by other players.
