

REFRIGERATOR

ABSTRACT

5 A refrigerator includes: a door including a first rib on a back side thereof, the first
rib protruding backward; a first engagement portion provided at an inner wall of the first
rib, an interior of the first engagement portion being filled with resin; a storage container
having a first fitting recessed portion at a wall portion raised at one side of a bottom
plate; and an egg tray having a tray in which a plurality of holes for support of eggs is
10 formed. The tray has a chamfered portion between a short side and a long side of its
peripheral edge, and the storage container is attached to the first rib by insertion of the
first engagement portion into the first fitting recessed portion. With the egg tray
accommodated in the storage container, the first fitting recessed portion is provided
inward of an extension line of the long side of the tray and a line that extends parallel to
15 the long side while passing through a connection portion between the chamfered portion
and the short side. The a distance between the short side of the tray and the side wall
in a direction along the long side is smaller than a width of the first fitting recessed
portion in the direction along the long side, and the tray and the first fitting recessed
portion do not overlap as viewed in plan view. With this configuration, a space
20 between the corner of the egg tray and the corner of the storage container can be
effectively used, improving the storage capacity of the storage container.
