

PEELING APPARATUS

ABSTRACT OF THE DISCLOSURE

A peeling apparatus includes a discarding unit configured to discard a protective member by stacking the protective member in a trash box. The discarding unit includes an inclined dropping unit configured to drop the protective member obliquely downward to an opening of the trash box, and a first inclined plate and a second inclined plate that arranged so as to face each other in a direction orthogonal to a traveling direction of the protective member when the protective member dropping obliquely downward above the opening is viewed from above. The first inclined plate and the second inclined plate are arranged such that a gap through which the protective member can pass is formed between a lower side of the first inclined plate and a lower side of the second inclined plate, and the first inclined plate and the second inclined plate are inclined.
