

SOFT PLASMA IGNITION IN
PLASMA PROCESSING CHAMBERS

Abstract of the Disclosure

5 The specification discloses a power supply
circuit (30) which reduces oscillations (26) generated
upon ignition of a plasma within a processing chamber
(14). A secondary power supply (32) pre-ignites the
plasma by driving the cathode (12) to a process
10 initiation voltage. Thereafter, a primary power
supply (10) electrically drives the cathode (12) to
generate plasma current and deposition on a wafer
(16).
