DEVICE FOR LIQUID COLLECTION

ABSTRACT

The present invention relates to a device for liquid collection. The colleting device comprises a base having a return end portion for collecting and removing a liquid generated by an air conditioning unit. The collecting device further comprises attachment means connected to the base for attaching the base to a portion of the air conditioning unit. When attached thereto, the base is at an incline to the portion of the air conditioning unit with the return end portion being the lower end of the incline. The collecting device enables liquids generated by the air conditioning unit to be collected and removed so as to prevent the liquids from dripping, for example, to lower housing units of an apartment building.
