

BOX III. Text of the abstract

A system and integration infrastructure to provide a distributed matrix or neural network of connected real-time decision support modules designed to perform business intelligence evaluations in real time. The system comprises an executive control module for controlling plural distributed agent neurons for monitoring activities of business application software and application interception neurons for intercepting customer information between databases and business application software. The executive control module further receives inputs from the neurons and simulates the interaction between the neurons. The executive control module can then implement the result of the simulation to the neurons.
