

## WEARABLE BELT MASSAGE APPARATUS

### ABSTRACT

A wearable belt massage apparatus, of which surfaces are covered with a woven material and which is wearable on a user's neck or shoulder, is disclosed. The wearable belt massage apparatus makes it possible to efficiently massage a user's body with the helps of a built-in vibrator equipped with a solenoid. A wing part is symmetrically formed with respect to a center of a belt, by means of which it can be wearable on a user's neck, and a vibrator capable of generating vibrations using a solenoid is disposed in a center of the massage apparatus for thereby efficiently massaging a user's body. Since the vibrator disposed in the massage apparatus operates without external force, it can be naturally worn on a user's neck for massaging a user's neck or back without giving a lot of loads to a user's hands and arms.
