(54) Title: METHOD AND DEVICE FOR IDENTITY AUTHENTICATION

(54) 发明名称: 一种身份认证方法及装置

图 1 /FIG. 1

S101 When the user performs the specified operation, the terminal collects the action attribute information of the users in the process of the specified operation
S102 On the basis of the preset standard information, it is determined whether the action attribute information is matched with the standard information
S103 If the authentication is successful, the corresponding processing is performed on the basis of the specified operation
S104 If the authentication is failed, the corresponding processing is not performed on the basis of the specified operation
AA No
BB Yes

(57) Abstract: Disclosed in the application are a method and device for identity authentication. The method comprises: when the terminal is in the specified stress state, action attribute information of the terminal is collected; the action attribute information is processed by matching with a preset sample information; if the action attribute information matches with the sample information, the authentication is successful, and if the action attribute information does not match with the sample information, the authentication is failed. By the above method, the terminal can automatically collect the corresponding action attribute information in the process that users perform certain specified operation, and then match and compare with the preset standard information to authenticate the identity of the current user using the terminal. Therefore, the terminal can collect the action attribute information and set up or authenticate it without entering a specific acquisition mode in the process that the user operates and uses the terminal. It avoids interfering with the use of users, and also effectively improves the convenience of operation.

(57) 摘要: 本申请公开了一种身份认证方法及装置, 该方法为终端处于指定的受力状态下时, 采集该终端的动作属性信息, 根据预先设置的样本信息对所述动作属性信息进行匹配处理, 所述动作属性信息与所述样本信息相匹配, 则通过认证, 所述动作属性信息与所述样本信息不匹配, 则认证失败。通过上述方法, 终端会在用户执行某些指定操作的过程中自动采集相应的动作属性信息, 再与预先设置的标准信息进行匹配对比, 以对终端当前使用者进行身份认证, 从而, 终端在用户进行操作使用的过程中, 不进入特定的采集模式就可以采集动作属性信息并进行设置或认证, 避免了对用户的使用造成干扰, 也有效提升了操作的便利性。
