(54) Title: USING CREDENTIALS STORED IN DIFFERENT DIRECTORIES TO ACCESS A COMMON ENDPOINT

Fig. 1B

(57) Abstract: A global endpoint may be associated with an organization name and a plurality of directories located in different geographic regions. The global endpoint may be a computing system that hosts a page used by users to access an application or service. A user may be able to access the application or service using already existing credentials. For example, the user may access the application or service using credentials stored and maintained by an entity with which the user is affiliated. Users having credentials stored in different geographic regions may be able to access the application or service via the same global endpoint.
