

MOBILE INFORMATION PROVIDING AND TRANSACTION SYSTEM

Abstract

5 A method and a system for providing specific information on demand to at least one requester on a mobile messaging network are disclosed. The method and system involve the steps of receiving a query from the at least one requester and extracting at least one search character from the query. The method and system also involve providing at least one database containing at least one heading, wherein each of the at least one heading is associated with at least one field while each of the at least one field is associated with at least one entry. The method and system further involve matching each of the at least one search character with the at least one heading, the at least one field and the at least one entry to thereby associate one of the at least one entry with the query. The method and system finally involve retrieving the one of the at least one entry from the at least one database.
