

ABSTRACT

Provided in the present application are a page rendering method and apparatus, and a device, a storage medium and a program product. The embodiments of the present application can be applied to page rendering scenarios of applets of application software, operating systems, etc. The method comprises: in response to a starting operation for an applet, starting a browser process of a browser by means of a client process of an application program client, and executing a service logic code of the applet by means of the browser process, wherein the applet runs in the application program client; in response to the browser process executing a calling code in the service logic code in respect of a first rendering function, sending a calling processing request to the client process by means of the browser process, wherein the first rendering function is a graphic rendering function that is called by the browser process, and the first rendering function is used for rendering a page frame of the applet; in response to the calling processing request, determining, by means of the client process, a second rendering function corresponding to the first rendering function, and calling the second rendering function, wherein the second rendering function and the first rendering function have the same graphic rendering function; and performing graphic rendering on the page frame of the applet by means of the second rendering function, so as to obtain a rendering result of the page frame of the applet.
