

ABSTRACT

MOBILE BASED COLLABORATIVE AND INTERACTIVE OPERATIONS WITH SMART MOBILE DEVICES

A system, method, and an apparatus relate to a system for electronic communication between personnel, and sharing tasks and plant device operating statuses. The use of electronic communication allows for interaction between personnel at different locations and provides real time communication between personnel regardless of their location, whether they are on-site, in a meeting, or out of office. Additionally, the use of electronic communication allows for concurrent viewing of information by all the personnel rather than individually viewing a singular physical log book.
